(particularly in German writers on recent advances), to compile a more or less connected summary of the published work in a given domain during a chosen number of years and designate such a compilation as "recent advances" Such a work is on the whole not in the tradition of English physiology, which, in addition to making some of the most fundamental discoveries in physiology, has never lost a certain subtly philosophical attitude towards the subject It is not a matter of surprise to find that among our greatest physiologists in recent times we find a poet, a philosopher, and a mathematician

In Dr Newton's expositions we detect not a little of the desire to discover in the mass of facts at his disposal the undercurrent of what we may loosely call the fundamental reality behind the experimental results For the purposes of such a subject as physiology the perception of the "reality" lying behind the diverse experimental results, often apparently conflicting with one another, constitutes the advance For physiology as such does not advance it is our perception, appreciation, and sometimes application of fundamental physiological harmonies, correlations, and properties which advance The extraction of these fundamentals from out of the tangled masses of experimental results and their presentation in such a way as to produce in the mind a composite picture which is assimilable with not too great difficulty is, as we conceive it, the task of the writer of a book on recent advances Dr Newton has in his book fulfilled these requirements with notable success, and his work will be welcomed by those who have pride in the writings of English physiologists

Notes on Books

LUCAS'S *Forensic Chemistry and Scientific Criminal Investigation*, now appearing in its third edition (E Arnold, 18s), has become well known and is held in high esteem by practitioners of scientific work in regard to crime Occupation in this work calls for alert regard to the danger of overlooking the significance of a feature of observation and the no less danger of ascribing such a feature to a cause that is not the true one It calls for extensive experience in the branch of work undertaken and for a knowledge of other workers' experience Such is the substance of the matter contained in Lucas's book It bears the stamp of having been written by one who has encountered the difficulties attending the work and who has overcome them It is rich in the description of evidence to be adduced from observation and of methods by which such evidence may be revealed It also gives timely warning of contingencies in which the evidence sought may be wanting through interference by accidental conditions as well as of the occasions when such evidence may be a false indication The scope of the matter treated is extensive It includes poisons, blood stains, effects traceable in clothing, counterfeit coinage, forged writing, and the reproduction of finger-print marks, and various matters connected with incendiarism firearms, and projectiles The features of the book which render it so useful are the descriptions of manipulative detail

Many Days in Morocco, by JOHN HORNE is now published in a revised and enlarged edition (Philip Allan and Co, 12s 6d) The author describes the country as a strange mixture of North and South, East and West, Europe and Africa Mosques have the pointed roofs of Europe in place of the gleaming domes of the East, minarets are square and thick instead of round and tapering, the multitude of storks' nests on pinnacle and tower seem more appropriate to Germany than to Africa Morocco may well be called "the land of paradox" Mr Horne weaves into the account of his own travels and adventures much interesting information on the history and customs of the people He devotes one chapter to Xauen, a mountain stronghold on the edge of the Riff Many of its inhabitants are descendants of the Moors who once overran the southern provinces of Spain, and the town still gives a faithful picture of what Moorish Granada must have been in the fifteenth century In this new edition are included the author's impressions of modern developments of Morocco under French influence, beneath which the still waters of Islam continue to flow as deeply and mysteriously as in former days The book is illustrated by excellent photographs

In *Les Encephalites Algues Post-infectieuses de l'Enfance* (Paris, Masson et Cie, 30 fr) Mlle M T COMBY has chosen a subject to the knowledge of which her father, Dr Jules Comby, the veteran Paris paediatrist, has made such valuable contributions Her book forms one of the outstanding Paris theses of recent years It is divided into six chapters devoted respectively to the historical aspects, detailed clinical description, primary diseases, morbid anatomy, aetiology and pathogenesis, and diagnosis, prognosis, and treatment Brief histories of forty-five cases in patients aged from 2 months to 23 years are then recorded, followed by an extensive bibliography of a truly international character, including the most recent British literature The work is an excellent contribution to the literature of the subject

The Animal's World, by Professor DORIS MACKINNON (G Bell and Sons, 7s 6d) is an expansion and modification of a course of popular broadcast talks on biology in which she participated The book is written primarily for children, and it is obvious that the author thoroughly understands the mentality of the modern child The somewhat patronizing attitude from which omniscient grown-ups write the majority of children's books is refreshingly absent Instead one has the impression of a peculiarly wise and instructed child telling, in simple and straightforward language, an interesting story to her fellows Since the author is herself a zoologist, and as she believes that the study of animal life offers the easier approach to biology, the greater part of the book is devoted to this aspect of the science Outlines of anatomy and physiology are pleasantly mingled with the economic and sociological sides of the animal world So full and varied is the information in this book that adults, as well as children, will derive pleasure and profit from reading it, and middle-aged doctors will regret that they did not receive their introduction to biology in such palatable form The book is profusely illustrated with photographs and diagrams, all of which are apposite

Dr HALLIDAY SUTHERLAND'S *In My Path* (Geoffrey Bles, 10s 6d) is not such a good book as either *Arches of the Years* or *A Time to Keep* but no author can be expected to maintain the highest standard indefinitely In the present volume, borrowing a metaphor from the kitchen, the food is good, and the cooking is good, but the choice of dishes results in a rather indigestible meal The transitions from light to serious themes are almost uncomfortably abrupt The opening chapters, with their personal reminiscences, are in the author's happiest vein Some strange experiences befell him as a temporary naval surgeon during the war, and there is a masterly description of a secret necropsy on a case of miliary tuberculosis Two subsequent chapters are devoted to the tubercle bacillus and the story of tuberculin, subjects on which Dr Sutherland is well qualified to write There follows a vivid tale of a rejuvenation operation, which points a moral, a scathing and humorous commentary on modern life, entitled "The Woes of the Rich", and a fantasy, reminiscent of Aldous Huxley, representing life in London in some future century under a nightmare multiplication of bureaucratic control This is a satisfactory book for the busy doctor who has only odd half-hours for reading, since each chapter is complete in itself

INFECTIVE HEPATIC JAUNDICE*

BY

HUGH BARBER, M D, F R C P

Honorary Physician Derbyshire Royal Infirmary

During the last few years sporadic cases of the infective hepatic jaundice type have been common in South Derbyshire and several epidemics have been described in this or adjacent districts Montford (1934) recorded forty-five cases in Castle Donington (population 2 674) in 1933, only two of which were in adults Frazer (1935) recorded jaundice in twenty five children all attending the same day school in Newhall Richards (1933) described an epidemic among adults attending the Derbyshire Royal Infirmary for anti syphilitic treatment of which there were 120 cases It is true that all except one had received, at some time an arsenobenzol compound but the epidemic was due to close contact in the waiting room and died out when this was remedied

If we exclude spirochaetal jaundice and discuss simple infectious jaundice we have a subject suitable for a clinical society, because any one of us may have the opportunity of studying the natural history of the condition more fully and the chance to add something to medical knowledge It was Pasteur who said In the scientific world chance only comes to the mind that is prepared

Nomenclature

Our subject will include (1) Catarrhal jaundice proper in epidemic and sporadic form this is essentially a gastritis passing on to the duodenum, whence inflammation spreads up the bile duct leading to obstructive jaundice (2) Infective hepatic jaundice, also occurring in epidemic and sporadic form, which is an acute hepatitis giving rise to toxic jaundice From this second group arise some cases of acute or subacute necrosis of the liver, which is a better-defined name than acute yellow atrophy or the clinical label icterus gravis

Much has been written under the title epidemic catarrhal jaundice since Cockayne (1912) distinguished the milder type of epidemic jaundice from that due to the spirochaete In recent years although the name catarrhal has been retained the trend of opinion and much of the evidence has been toward a mild toxic jaundice as the explanation of the cases For this disease infective hepatic jaundice is the name of choice Hurst and Simpson (1934) have published convincing evidence that catarrhal jaundice and infective hepatic jaundice are two distinct diseases which have been confused We may return to this under the appropriate headings below when discussing the features about which further clinical observation is needed A paper recently published entitled 'Non spirochaetal Infectious Jaundice illustrates the difficulties of nomenclature It is probable however that in the future we shall group most of the cases both epidemic and sporadic under the title of infective hepatic jaundice with an occasional group attributable to the rarer condition catarrhal jaundice

Some Features of the Epidemics

In the Wensleydale epidemic, reported by Pickles (1930) there were 250 cases of jaundice in a population of 5 700 people The majority of those infected were elementary school children and close contact in school was a definite source of infection There were no fatal cases A few children had pain suggesting some acute abdominal lesion The incubation period was twenty five to thirty five days and the period of infectivity short

Glover and Wilson (1931) observed an epidemic in a country town of 6 000 people in 1930 There were two or three hundred cases in the town In one family jaundice began in four children on the same day There were two large boarding schools in the town In a girls school with 250 boarders there was no jaundice although one of the teachers was affected during the holidays In a boys school with 400 boarders there were ninety five cases of jaundice It was thought that infection was spread by the nasopharynx and as evidence of close contact we have seven cases of jaundice out of nine boys in one dormitory and five out of nine in another

Bashford (1934) recorded forty eight cases of jaundice during the months of June and July 1934 in workers in the General Post Office in London In one building where there were 1 900 workers there occurred forty three of these cases but they were spread over four different rooms This would suggest that the condition is highly infectious but that the majority of adults may have acquired an immunity None of them carried infection to their own homes where they remained during *the illness, and all recovered*

A study of the epidemics described will show that they tend to occur in rural districts and in institutions It is most infectious to children is the result of close contact and the stage actually infectious is short The incubation period is a long one, probably between three and five weeks

Clinical Features of Infective Hepatic Jaundice

The onset is fairly sudden with perhaps one attack of vomiting there is an early rise of temperature with jaundice usually appearing next day Malaise is pronounced The liver is enlarged and the spleen appears to vary in size in different epidemics There is some bile in the stools and the van den Bergh reaction is biphasic being characteristic of a toxic condition In a number of cases there is only jaundice with the other symptoms reduced to a minimum Exceptionally there may be severe abdominal pain A few cases have a good deal of vomiting In one or two epidemics the illness has begun with a sore throat The jaundice lasts a variable time usually one to three weeks Convalescence is slow

Prognosis in Infective Hepatic Jaundice

The great majority of the patients get perfectly well Some liver efficiency tests carried out by American observers (Soffer and Paulson 1934) suggest that frequently the organ does not recover fully The observations however, are few and the tests themselves not of proven value The clinical evidence is all in favour of complete recovery in most cases although a follow up over several years by those who have observed epidemics will be the most valuable evidence There is no doubt that convalescence may be very tedious A colleague of mine in a neighbouring country town where there has been an epidemic tells me of an adult who felt miserably ill for three months after what appeared to be quite a mild attack

Though death is an exceptional event it is necessary to treat these apparently simple cases of jaundice with respect because there may be much damage to liver tissue without symptoms arising to give warning of the fact This latency of symptoms in hepatitis is borne out by the experimental evidence of giving sublethal doses of chemical toxins to animals

TENDENCIES OF CONTEMPORARY MEDICINE

We are living in an epoch of profound transformations, which challenge the established order in which we have been brought up and even call in question matters which in our pride we had regarded as fixed and assured These changes show the relativity of our points of view and our conceptions The state of flux shows up in all domains—economic, political, social, scientific, and philosophic A revision of values, a readaptation, is demanded on all sides At the end of the last century men put material things first, they looked at the things of life from outside, ignoring often the human values Now there is a growing sense of the needs of man and study of his reactions to his surroundings It is not possible to separate the future of medicine from this new humanism

In a subject of such comparatively recent origin as scientific medicine we must expect growing pains, and in his essay on the tendencies of modern medicine Dr Delore[1] of Lyons suggests that one of these crises is upon us He accepts Professor Harvey Cushing's description of medicine as at the cross-roads Medicine of the nineteenth century and even of to-day is predominantly, almost exclusively, analytical This has occurred because all the ancillary sciences in the training of the medical student are in essence analytical The spirit of the laboratory has tended to supplant the clinical sense Each problem is tackled as an entity This method leads only to erudition, the accumulation of isolated facts, and the broad general principles, the science, and the plan are left in abeyance Further, there is separation of man into mind and body, of man from his surroundings Delore sees as consequences of this attitude a predominance of the morphological sciences, an increase of specialization to the detriment of general culture, materialism, and, more particularly, a one-sided view of the problems of infection and immunity, emphasizing the role of the infecting agent and neglecting the equally important reactions of the host The tendency has been to accumulate material, and this is useless unless subjected to a succeeding process of synthesis Medicine should become more human, treating the whole man as one psycho physical complex Medicine in future must serve the man, whether thinking, working, or suffering Medicine thus interested in the study of the person must turn more and more to consider the disturbance of function This point of view is developed on philosophical lines by von Bergmann in a book reviewed at page 74 this week The accurate knowledge of the first change in function, the real onset of the disease, leads to an earlier diagnosis in the pre-clinical stage Thus preventive medicine must be for the individual not only preventive but abortive

The remarkable advances in the science of bacteriology during the last fifty years have led to neglect of the diseased person, the terrain But there is need to return to Claude Bernard, who taught that the microbe is nothing, it is the terrain that is all Of the two factors in disease it is the terrain, the soil, the reacting capacity of the individual, which is the more important, it is this which controls the morbid reaction Taking as examples of morbid processes cancer, tuberculosis, and infectious diseases, not only because of their importance in pathology but because they give striking instances in his argument, Delore notes in cancer the fundamental role of the terrain or soil, there is lack of specificity of the exciting or occasional factors In tuberculosis both the bacilli and the terrain are of importance In the infectious diseases the terrain intervenes least, the external agent appears to have the preponderating part But even here there is over-emphasis of the part played by the infecting bacteria Often there is an absence of contagion, epidemics vary in character in a way inexplicable on strictly bacteriological lines, very often the microbe is latent and the disease sets in unexpectedly, in many infections no determined microbe is found, and filterable viruses are postulated, there is much mutability and pleomorphism of bacterial agents All points to need for considering the terrain or soil In tuberculosis the real acquisitions in therapy are outside the domain of bacteriology The revival of the age-old triad, rest, fresh air good food, is directed not against the microbe but to aid the general state The method of artificial pneumothorax is a clinical acquisition

It is thus that Delore is brought to the position that the future medicine is the treatment of the patient with physical and psychological measures These measures may be simple dieting, fasting, physical therapy and exercise, the treatment with drugs in the optimal, even minimal, therapeutic doses They are the revival of the lessons of clinical experience To assure the diagnosis determining the pathological lesions to be verified post

RECURRENT EXTRAGENITAL HAEMORRHAGES

BY

WILLIAM H GOSSIP, M B , Ch B

Honorary Assistant Surgeon Westmorland County Hospital

To the occurrence at regular intervals of extragenital haemorrhages from one or other part of the body at or near the time of the menstrual period the name vicarious menstruation has been given In the majority of the cases described in the literature such a designation is not strictly accurate as there is a lack of convincing evidence to show that the abnormal bleeding is in reality, in the nature of a menstrual discharge With a few exceptions they can merely be classified as cases showing recurrent extragenital haemorrhage with an indefinite relationship to the menstrual cycle But, although the occurrence of true vicarious menstruation is so rare, the old name seems to have come to stay and is still handed down from one generation of students to another

Two varieties of vicarious menstruation are described In some instances the haemorrhage appears to take the place of the normal uterine menstrual loss which is altogether absent. In other cases menstruation occurs with in addition some form of extragenital bleeding The former variety is known as substitutional while the latter is called supplementary menstrual haemorrhage

Review of the Literature

The condition is a relatively rare one This extremely rare abnormality says Bethel Solomons (1934) and Novak (1931) credits Lawson Tait with the remark, I do not absolutely deny that there is any such thing as vicarious menstruation, but I do deny the propriety of examiners at the University of London or anywhere else asking the commonest cause of epistaxis and receiving the answer of vicarious menstruation with approval! Novak (1931) quotes an extensive study of the literature made by Roth who traced 225 cases since 1870 In his series the sources of the haemorrhages were nose 30 per cent , nipples stomach mouth and throat, 4 to 5 per cent skin and fistulae 10 per cent lungs 8 per cent , bladder eye, ear intestines, and vagina, 3½ to 4½ per cent Of his cases in 25 per cent the bleeding was purely vicarious—that is substitutional in 75 per cent supplementary to the normal uterine loss

Other authorities disagree with these findings Bethel Solomons (1934) regards haemoptysis haematemesis melaena epistaxis and purpura as being the most common manifestations but the general consensus of opinion seems to place the sources of the haemorrhage in order of frequency as follows

1 *Nasal Mucous Membrane*—The haemorrhage may be quite severe or only very slight but in either event it may persist throughout the normal period Apparently no one has yet explained why the nasal mucous membrane should so often be the source of these bleedings but Novak (1931) suggests that the cause may be closely related to the occurrence of the so called nasal dysmenorrhoea

2 *Stomach*—Usually only slight bleeding

3 *Intestine*—Generally slight and appearing as blood in the stools during the menses

4 *Lungs*—Haemorrhages may have fatal results

5 *Breasts*—As a rule merely a sero sanguineous discharge at the menses but there may be definite blood

6 *Skin*—Haemorrhage from the skin occurs as bloody sweat Erythema of local patches of skin develops and is followed by oozing of pure blood or there may be a purpuric rash only

7 *Lips*

8 *Eyes and Eyelids*—Haemorrhage into the retina with each period has been recorded by Huizinge Powell, and others Claiborne (Novak 1931) has reported one case of vicarious haemorrhage from the lower lids

9 *Naevi*

10 *Kidneys*

11 *Old cicatrices*

12 *Abdominal fistulae*

13 *Umbilicus*—A case is reported by Gardner (1898) For three months in succession his patient bled from the umbilicus at the menses for twenty four to forty eight hour

Other rarer sites are teeth gums varicose ulcers amputation stumps external auditory meatus nails and haemorrhoids

Problem of Causation

There is one common factor in most of the reported cases—namely that uterine menstruation has been suppressed or less than normal In the majority of cases irregular amenorrhoea has been the rule In spite of much speculation no satisfactory explanation has been put forward Most of the theories are based on the assumption that menstruation is not a local but a systemic process Barnes (Novak, 1931) in a review of the explanations adduced submits the theories

1 That it is caused by plethora

2 That it is the result of a weakened condition of the tissues perhaps hereditary

3 That it is due to an abnormality in the structure of the blood vessels

More recently W H Condit (1916) in the *American Journal of Obstetrics* laid emphasis upon changes in the blood pressure at the time of menstruation These changes may be summarized briefly as being a rise in systolic pressure prior to and during the early part of menstruation and a diastolic rise during the period The pulse pressure is above average during the flow His evidence is unconvincing however A more reasonable explanation than any of the foregoing is given by Novak (1931) who suggests that in certain cases there is present in the various tissues an abnormal sensitivity to the action of the blood borne ovarian hormone with a result analogous to its action on the uterine endometrium That at least sounds logical more so than the idea that while the tissues themselves are normal an excess of ovarian hormone derived from supernumerary ovaries or accessory ovarian tissue such as is found in the broad and ovarian ligaments, may precipitate the vicarious haemorrhages

Menstruation and the Nervous System

In a proportion of cases there is a very definite relation between epilepsy and menstruation In so called hystero epilepsy the epileptic seizures come on a day or two before or at the onset of the period in the great majority of cases In the intermenstrual interval these hystero epileptics have no seizures On the other hand menstruation often brings on hysterical attacks in girls and women already predisposed In many such cases there is dysmenorrhoea of the spasmodic variety Dipgen and Schroder (1906) in a series of seventy five hysterical women noticed that menstruation began at an unusually advanced age and that it was abnormally scanty This they suggest as indicating defective development of the reproductive organs

D M Greig (1932) undertook an extensive review of the subject of recurrent bleeding from the eyes He quotes many recorded cases which serve to show that the hysterical state is more often the exciting cause than are puberal readjustments and menstrual irregularities

urinary infections open a new field which remains to be fully explored Setting these further possibilities aside, it may be said that the promised value of this treatment in streptococcal infections alone bids fair to place it among the major therapeutic discoveries of modern times

THE BART'S REPORTS

Volume 69 of *Saint Bartholomew's Hospital Reports*[1] contains numerous articles of interest to medical practitioners Dr E R Cullinan reviews a series of cases of subacute necrosis of the liver The form of acute necrosis called acute yellow atrophy has long been recognized Some cases are not fatal and may be called subacute, but apparently there is a similar underlying pathology, and at the other end of the series are cases usually called catarrhal jaundice In some instances a recognizable causative factor is evident, and the most acute cases occur in pregnancy or after various poisons such as chloroform, mercury, arsenic, apiol In many, however, the cause is not apparent, though an infection, possibly a virus, has been blamed Jaundice, often recurrent, is in the forefront of the clinical picture, with enlargement of the liver and bile in the urine, though the stools are seldom clay-coloured In severe cases haemorrhages and profound toxaemia may precede a fatal issue The essential pathological process is diffuse necrosis of the parenchymal cells of the liver with subsequent collapse and fibrosis of the framework After a time there is a period of repair and some regeneration of the liver may occur, which allows the functions of the liver to be carried on after the attack In a large hospital with a casualty department patients with perforated gastric and duodenal ulcers may be admitted with all degrees of shock and peritonitis A series of ninety-two consecutive cases of perforated gastric ulcer has been followed up by Mr R W Raven The immediate mortality of peptic ulcer was 23 per cent as shown by this series, an improvement on the figures collected (38 per cent) by Mr Girling Ball for cases treated in the same hospital during the years 1901 to 1922 The immediate operative mortality in Mr Raven's cases in perforated duodenal ulcer was 16 4 per cent, compared with a mortality of 29 8 per cent in the series of cases of perforated gastric ulcer The late results are encouraging 82 per cent of cases of perforated gastric ulcer which recovered from the operation remained in a satisfactory state of health, and 80 per cent of the series of cases of perforated duodenal ulcer In spite of the reduction in operative mortality which has occurred in recent years it is still high It is to be hoped that a better understanding of the disease and its treatment will still further improve the prospects of patients Partial gastrectomy as a method of treatment of peptic ulceration or of carcinoma of the stomach is an operation which has been increasingly practised by surgeons during the past fifteen years It is a procedure which, whatever, its therapeutic advantages, still has a high primary mortality even in the hands of experienced surgeons During the years 1919–31 the primary mortality of partial gastrectomy for peptic ulcer was 16 9 per cent, and for carcinoma of the stomach 25 5 per cent at St Bartholomew's In an interesting analysis of the morbid anatomical findings in fifty one patients dying as the result of partial gastrectomy, Dr R T Payne finds that peritoneal and pulmonary infections were responsible for thirty-six of the deaths Peritonitis, either local or general, brought about twenty of the deaths, and many of these were due to failure of response at the suture line rather than to technical error on the part of the surgeon It is suggested that adequate investigation and adequate pre-operative preparation with elimination of unsuitable cases would materially reduce the high mortality The sedimentation rate of red cells in citrated blood is a valuable guide in the prognosis of tuberculosis and arthritis Dr W G Oakley has extended the method to the investigation of seventy cases of acute and chronic nephritis In the preliminary acute tonsillar infection the sedimentation rate is appreciably raised, but usually shows a rapid return to normal except where acute nephritis supervenes The sedimentation rate appears to have no direct relation to the degree of proteinuria and to the urea-excreting function of the kidney, but is an index of the severity of the infection The sedimentation rate is persistently raised in all forms of chronic active nephritis, especially in the presence of oedema In the arteriosclerotic kidney the rate is normal or only slightly raised Long and important papers are included on lymphadenoma and on the deep x-ray therapy of malignant disease The volume also contains graceful references to the life and work of four distinguished Bart's men, Mr W T Holmes Spicer Dr R G Canti, Sir Archibald Garrod, and Sir Wilmot Herringham

[1] London John Murray (21s)

THE ANATOMY OF PAIN

In a brief paper Professor H H Woollard[1] has recently published results of experiments which appear to demonstrate beyond question that the sensation of pain on skin surfaces arises by the stimulation of a system of fine non-medullated nerves lying in the most superficial part of the dermis The non-medullated nerves do not end in "organized" nerve endings such as Meissner's corpuscles, but terminate either as closed loops lying in a plane parallel to that of the skin or as long naked neurofibrillae Only rarely do fibrils penetrate into the epidermis, which is thus essentially an organ of touch The structure of the pain nerve endings explains the reason for the poorly localized sensation of pain Pain in the deeper regions of the dermis is attributed to the stimulation of (1) the fine accessory fibres which are seen in relation to the more organized nerve endings such as the corpuscles of Pacini and Meissner and Krause end-bulbs, and (2) fine terminal fibres similar to those in the superficial layer of the dermis

July 2nd—Epistaxis haemorrhage from ears and eyes
July 4th—Bleeding from ears eyes nose and umbilicus
July 5th—Slight haematemesis period began
July 12th—Has had haemorrhages off and on from eyes ears nose and umbilicus period ended
July 13th—Seen by physician no evidence of organic lesion of central nervous system heart sounds normal blood pressure 115/80 mm. Hg
July 14th—Blood examination red blood cells 4 400 000 diameter 7·17 μ haemoglobin 74 per cent colour index 0·84 bleeding time normal white blood cells 7 750 per c.mm differential count polymorphs 69 per cent eosinophils 6 per cent., monocytes 1 per cent lymphocytes 24 per cent (large 10 per cent. small 14 per cent)
July 16th—Blood calcium 10·05 mg. per 100 c.cm
July 22nd—Seen by ear nose and throat surgeon who reported no source of bleeding manifest in the auditory apparatus
July 24th—Seen by ophthalmologist Vision normal in both eyes bluish sclerotics fundus normal
July 28th—Discharged
August 15th—Seen at surgery Feels and looks well Period on August 1st as expected no accompanying haemorrhages
Thereafter lost sight of as she left this district

Conclusions

Into what category can we fit this case? The salient features are a history of previous rheumatism of the nervous system, with a degrading home life and with a half formed dread of developing hystero epilepsy in a girl who after a definite illness exhibits hysterical attacks at the time of menstruation accompanied at times by extragenital haemorrhages Such a picture does not altogether correspond with one's idea of true vicarious menstruation—that is substitutional haemorrhage The sequence of events is not definite enough—sometimes she had fits sometimes amenorrhoea, sometimes normal uterine loss, and sometimes extragenital haemorrhages, and sometimes a combination of these phenomena Nor does it fit in satisfactorily, though it is closer to it, with one's ideas of the supplemental variety of vicarious menstruation for the haemorrhages did not always correspond with the menses

A study of the facts of this case offers no explanation as to the exact mechanism of the haemorrhages except of a rather negative kind In this case they did not seem to result from plethora nor changes in the blood pressure Nor does her past menstrual history suggest that defective development of the pelvic organs was a factor in their causation Apart from a tentative and non committal 'vasomotor instability' there seems no obvious explanation *Certainly self inflicted trauma can* be altogether ruled out—the bleeding was seen by many witnesses including sceptical sisters, nurses and house surgeons

There is however, no doubt in my mind but that the fits were purely hysterical in character An old choreic is a notoriously emotional individual at best and this girl's attention would seem by a chain of circumstances to have been focused on her menstrual habits and irregularities with a resultant mental disturbance

My thanks are due to Professor Leyland Robinson for his interest in and help with this case

THE FRIEDMAN TEST IN HYDATIDIFORM MOLE AND CHORION EPITHELIOMA

BY
P. LAZARUS-BARLOW, M.D.
Honorary Pathologist Royal East Sussex Hospital Hastings

The following four cases in which the forty eight hour Friedman test was used show the value of the test so clearly that they seem worth recording The test was used (1) to establish the presence of a *hydatidiform mole* or a chorion epithelioma (2) as a criterion of the complete removal of a mole or the presence of a subsequent chorion epithelioma and (3) as evidence of the absence of secondary deposits after hysterectomy for chorion epithelioma

Case I

A patient aged 29 years was admitted on January 6th 1934 for an incomplete abortion The menstrual periods had been regular the last being on October 29th 1933 She started bleeding on December 21st and the loss had continued off and on until admission after admission clots were passed at times On January 16th 1934 the os was dilated and two pieces of what resembled placental tissue were removed On the 22nd products of conception resembling a vesicular mole were discharged Histological examination showed a hydatidiform mole with considerable degeneration On January 30th the Friedman test was positive She was sent home on February 10th to attend as an out patient for further tests On March 6th the reaction was positive and again on March 26th when she was readmitted for vaginal haemorrhage Panhysterectomy was performed two days later on the strength of the Friedman test having remained positive for over two months after the passing of the mole There was a small tumour in the uterine wall at the fundus which proved histologically to be a chorion epithelioma On April 15th the test was positive and on April 23rd weakly positive The patient was discharged on May 17th and further tests as an out patient on July 3rd August 1st and August 27th were all negative

Case II

A patient aged 27 years was admitted on January 11th 1934 for an incomplete abortion The periods had been regular but profuse the last being on September 12th 1933 In October 1933 a brownish discharge began and persisted Two weeks before admission she started to lose blood at times profusely On January 27th 1934 the cervix was dilated and the products of conception removed These resembled a hydatidiform mole and histologically very degenerated and oedematous chorionic villi were seen On January 31st a vesicular mole was passed and on February 16th the patient was discharged On February 26th March 26th and May 24th the Friedman test was negative *On* September 2nd the patient reappeared complaining of a brownish discharge the test was negative *On December 27th the test was positive* with a history of nine weeks amenorrhoea The patient has since been delivered of a full term healthy child

Case III

A patient aged 25 years was admitted on April 12th 1934 for flooding after a two months abortion six weeks previously On April 15th the uterus was explored and a friable mass removed histologically this was a chorion epithelioma On the 16th the Friedman test was positive Panhysterectomy was performed on the 23rd On May 1st the test was weakly positive and it was completely negative on May 22nd June 25th July 3rd and November 12th 1934

A UVEAL SYNDROME

Of late years a growing number of cases have been reported in which uveitis is associated with changes in the pigmentation of the skin and hair, and also with affection of hearing The uveitis itself is so severe as to resemble the reaction seen in sympathetic ophthalmia The pigmentary changes of the hair are most evident in the eyelashes, which become grey, though any hairy region may be involved, and in extreme cases there is alopecia The skin shows a varying degree of vitiligo, and the auditory affection is generally of the nature of a transitory middle-ear catarrh The older literature abounds in observations which seem to indicate a partial recognition of this syndrome Thus Nettleship in 1884 reported depigmentation of the eyelashes in a case of sympathetic ophthalmia and referred to an earlier case of Hutchinson's in which a severe plastic uveitis of non-traumatic origin was accompanied by changes in the eyelashes The occurrence of alopecia, poliosis, and dysacousia was reported in sympathetic ophthalmia by Clamer in 1914, but what is of interest in the more recent cases is the presence of this symptom-complex in uveitis not of sympathetic origin How far these changes constitute a clear-cut syndrome it is difficult to decide, as some of the components of the syndrome have been observed in ocular affections other than the severe uveitis described above Thus poliosis has been noted in trigeminal neuralgia and in bilateral iridocyclitis, and vitiligo has been observed in optic neuritis It would, however, seem that even in such cases uveitis has been present in one form or other, and these observations may well have been instances of partial recognition of the syndrome As things stand at present the feature that is stressed by recent observers such as B Rones,[1] W S Davies,[2] and T H Luo,[3] is the extreme severity of the ocular affection—the reaction resembling sympathetic ophthalmia—and the complete absence of any definite aetiological factor No clearly established case of this syndrome appears as yet to have been reported in this country, and although there are several reports from America, most of the forty odd cases recorded have been in Japan To what extent pigmentation of the skin and of the fundus background are factors in this particular reaction is again a matter of difficulty, some of the American reports refer to negroes, and albinotic fundi are features in other cases

CARDIAC ISCHAEMIA

special lecture on "The Treatment of Cardiac chaemia" will be delivered by Mr Laurence 'Shaughnessy in the theatre of the Royal College of Surgeons of England, Lincoln's Inn Fields, W C, on Friday January 15 at 5 p m The lecture will be in wo parts (1) Experimental methods of initiating and supplementing natural reparative processes in coronary thrombosis and coronary sclerosis The provision of an additional blood supply to the heart by grafts of living tissue (2) Cardio omentopexy in man Operative technique and the case records of the first patients to be treated in this way Viscount Dawson of Penn, President of the Royal College of Physicians of London, will give a short introductory address

FACIAL CELLULITIS

The greater part of the face, in common with the subaponeurotic area of the scalp, constitutes a "dangerous area" from which infection is apt to extend intracranially by way of the venous channels A report on the study of fifty cases of facial cellulitis by P Chatterji and M N De of Calcutta[1] is a useful contribution to the subject It is probable that owing to a sodden epithelium from excessive sweating facial cellulitis is commoner in India than in this country The authors point out that constant perspiration keeps the skin surface always moist and unless this is kept scrupulously clean crops of furuncles tend to occur Clinically the majority of cases of facial cellulitis show signs of toxaemia and septicaemia, and the prognosis is grave, forty-four of the fifty cases studied by Chatterji and De ended fatally Organisms were grown from the blood of thirty-nine of the forty six patients from whom blood cultures were made, and *Staphylococcus aureus* was found in thirty-two and streptococci or mixed infections in seven The authors believe that too much importance has been attributed to the possibility of intracranial extension—that is, cavernous sinus thrombosis—and too little to the fact that a septicaemia or pyaemia may be established early and death take place long before the cavernous sinus is thrombosed For this reason, and because after occlusion of the angular vein it is still possible for infection to spread to the cavernous sinus by way of the pterygoid plexus, ligation of the angular vein as a prophylactic measure would not in the majority of cases seem to be indicated This is sound argument, and an incision necessary for ligating the angular vein may spread the infection Chatterji and De believe that attention should be concentrated on the treatment of septicaemia with its accompanying toxaemia Active measures applied to the lesion itself such as incisions, scraping, squeezing and handling of any kind, are only too apt to spread the infection and are to be condemned This is in accord with experience of cases of furuncles and carbuncles in the "dangerous area" of the face Treatment should be directed to the general condition, with only gentle local therapy in the form of hot fomentations and the application of magnesium sulphate paste The tendency to day is to treat all furuncles conservatively and to allow these lesions to discharge spontaneously when the local defensive mechanism and the development of the lesion have reached the optimum point Meddlesome incisions are painful and dangerous, and produce more conspicuous scars than those resulting from spontaneous evacuation

[1] *Indian med Gaz* 1936, 71 629

in the submucosal layer parallel to and a little above the lower border of the inferior turbinate till its point lies near the posterior end of this structure Here liberate 1 to 2 minims of the carbolic solution Then withdraw the needle till its point lies at about the middle of the turbinate liberate another 1 to 2 minims of the solution Once more withdraw the needle till its point is near the point of entry and liberate a final minim of the solution

7 Remove the needle quickly and at once paint the nasal cavity freely as before with 75 per cent alcohol (The alcohol tends to neutralize any of the carbolic solution which may have escaped from beneath the mucosa)

8 The patient should finally be made to gargle and wash out his mouth with the bicarbonate of soda solution

COMMENTARY

The middle turbinate may be treated, if necessary, by a similar injection, but only 1 minim of the carbolic solution should be introduced near the point of entry of the needle The turbinates of the opposite side may also be treated at the same sitting though it is better policy to allow an interval of a few days before doing so Extreme care should be taken to avoid perforating the mucous membrane with the needle point when running the needle along in the submucosal layer lest some of the carbolic solution escape and damage the ciliated cells If the procedure has been successfully carried out the mucous membrane should look markedly blanched almost immediately after injection Haemorrhage may be fairly brisk for a few minutes but soon stops when the patient can go home he should however be warned to expect a stuffy head cold for the following twenty four to forty eight hours The patient should return for inspection one week after injection when shrinkage will be found to be well advanced to become complete and permanent in three to four weeks The method may be employed alone or in combination with other forms of treatment Lastly, it is relatively easy of application once the technique has been acquired

Bath C A HUTCHINSON FRCSEd

Peripheral Neuritis as a Sequel to Sun-bathing

The following case may be worthy of recording

A woman aged 29 spent a very warm day last August *sun bathing at the seaside She lay on the beach for about* six hours without any covering on her head or neck That night she felt giddy and ill and the next morning found that she could not stand up owing to pain in her ankles

I saw her soon afterwards and found that both her feet were dropped and she was unable to flex them The knee jerks and the plantar reflexes were absent on both sides and there was loss of epicritic sensation over the outer sides of both legs and feet The temperature and pulse rate were normal albumin was absent from the urine there was no history of work in any toxic atmosphere and no trace of any specific disease

After twelve days rest and gentle massage she was able to get up but could only walk by dragging her feet along the floor Knee-jerks and sensation were then present but not normal She has now completely recovered

This appears to be a definite case of peripheral neuritis caused by undue exposure to the sun's rays and should be a warning that more unfortunate sequelae than blisters may result from sun bathing

Aberdare JAMES HANNAN MB, ChB

An Unusual Case of Anthrax

In 1929, as recorded in this *Journal* there came under my care a baby 15 months old suffering *from cutaneous* anthrax, the lesion being situated near the middle of the *anterior surface of the left forearm* Her father was employed in a local tannery, and it was presumed that the infection originated from spore infected dust carried *on his clothing* The age of the patient and her recovery made the incident an exceptional one, and a further interest lay in the fact that the baby's father had also been a patient of mine suffering from anthrax eight months previously

There has recently come under my care a patient an adult female, in whom an almost parallel series of circumstances are presented

CASE RECORD

Mrs X aged 28 years consulted her doctor on October 28th 1936 on account of an angry pimple which had followed upon a small scratch a few days before in the middle of the front of her left forearm and had grown worse The doctor suspicious of its appearance and alert to the liability to anthrax infection in the district, sent her to Dr H A Mitchell medical director Evans Biological Institute Runcorn for bacteriological investigation Anthrax bacilli definite though not numerous were found on direct film examination and she was at once sent to the City Hospital Fazakerley

On admission (October 29th) there was a typical malignant pustule about four inches above the left wrist, rather larger than a shilling with its ring of serosanious vesicles and dark centre and considerable swelling and induration reaching from the wrist almost to the elbow flexure There was no axillary adenitis and as usually experienced a comparative absence of severe pain Her general condition was good with no evidence of toxaemia The temperature was normal She at once received 180 c cm anti anthrax serum (Mulford) with in addition 0 3 mg neokharsivan intravenously eusol *fomentations were applied two hourly to the lesion and as* I have suggested elsewhere (1928) no excision was made

On the following day little alteration either way in the focus was to be seen and a further intravenous injection of 100 c cm anti anthrax serum (Mulford) was given The next day however a definite abatement in the local swelling was evident for this reason as well as the fact that she now earlier than ordinarily might have been expected developed a copious urticarial serum rash no more serum was given The rash lasted for two days

The swelling and induration continued to subside rapidly and the infected focus shrivelled By November 3rd cultures from the lesion were negative The necrotic centre dried and was cast off in ten days or so leaving a shallow healing ulcer and this having healed the patient left hospital on November *24th little the worse for her adventure*

The bacteriological diagnosis was confirmed by film culture and guinea pig inoculation by Professor Hedley D Wright city bacteriologist Liverpool as also were the later cultural investigations

REMARKS

The special interest in this case arises from the fact that the patient is a housewife and does not do any other work Her husband, however is an employee at a local *tannery* and it is a reasonable inference that his wife's infection resulted from anthrax infected dust carried from his work on his clothing Coincidence goes a step *further* as he himself was a patient under my care in this hospital six years ago suffering from anthrax

House, Tavistock Square, W C 1, for a card of admission All who attend the address will be asked to accept a copy of the British Medical Association's new *Medical Practitioners' Handbook*, which contains a wealth of information of interest and value to all medical practitioners, particularly those who have recently qualified

Medical Charities

The subscriptions to medical charities which have been collected by the Association during the period April 17 to November 26, 1936, amount to £1,777 17s 2d This total includes £407 8s 10d earmarked for the Royal Medical Benevolent Fund, £158 15s 8d for the Royal Medical Foundation of Epsom College, £8 10s for the Royal Medical Benevolent Fund Society of Ireland, and £465 14s (including a grant of £450 from the Medical Insurance Agency) for the Sir Charles Hastings Fund The subscriptions which were not earmarked for particular charities amount to £737 8s 8d, and this sum will be distributed by the Association according to the needs of the various funds

A conference of local authorities in the Highlands of Scotland recently discussed the question of the appointment of a medical consultant for the Royal Northern Infirmary, Inverness The Department of Health for Scotland has indicated to the Inverness County Council its willingness to contribute £600 a year for five years toward the salary of the consultant appointed

HOSPITAL CO-OPERATION

In the *Supplement* of January 2 (p 4) reference was made to the advantages of co-operation between local authorities and voluntary hospitals on the subject of hospital provision Section 13 of the Local Government Act, 1929, provides that

"the council of every county and county borough shall, when making provision for hospital accommodation in discharge of the functions transferred to them under this Act consult such committee or other body as they consider to represent both the governing bodies and the medical and surgical staffs of the voluntary hospitals providing services in or for the benefit of the county or county borough as to the accommodation to be provided and as to the purposes for which it is to be used'

In two areas in the provinces—Manchester and Oxford—particularly efficient action has been taken to provide permanent machinery for carrying out the intentions of this section of the Act The first annual report of the Manchester Joint Hospitals Advisory Board has already been noticed in the *Journal* (November 28, 1936, p 1109), but it may be of interest to members in other areas to have a detailed account of the constitution and the work of the advisory organizations in both cities

In Manchester and Oxford it has been recognized that, although the duty imposed upon local authorities by Section 13 consists only in consultation with representatives of voluntary hospitals, consultation alone will be of little value unless there is also continuous, close, and effective co-operation, and some means of giving effect to the decisions and recommendations of the members of the conference The local authorities in these two areas have therefore determined to go beyond the bare obligation imposed upon them, and to introduce the co-operation which is evidently intended by the spirit of the Act For this purpose they have devised, with the help of the local voluntary hospitals, joint hospitals advisory boards to consider and advise upon all questions affecting hospital services

The Manchester Scheme

Conferences between the Manchester City Council and the voluntary hospitals took place even before the passing of the Local Government Act, but it was not until 1934 that the Public Health Committee appointed a special subcommittee to consider, among other matters, the correlation of the work of the municipal hospitals and the voluntary hospitals The Manchester Voluntary Hospitals Council, which is representative of all the voluntary hospitals in the city, also appointed a committee to consult with local authorities, and the first of a series of conferences between the two "Section 13" committees took place in March, 1935 A basis of discussion was provided by a draft scheme prepared by the medical officer of health for the formation of a permanent advisory body and eventually the constitution of a Joint Hospitals Advisory Board was formulated During the discussions it became clear that the co-operation of the University of Manchester would be necessary to the success of the scheme, and the University, as incorporating the medical school of the city, was offered and accepted representation on the board The scheme prepared received the final approval of the City Council and the Voluntary Hospitals Council, and in October, 1935, the first meeting of the Joint Hospitals Advisory Board was held

Joint Hospitals Advisory Board

The joint board consists of ten members of the Public Health Committee of the City of Manchester, eight members of the Hospitals Council and Statutory Committee, five members of the University of Manchester, and one representative of the Manchester Division of the British Medical Association, together with the medical officer of health Its functions are to consider matters coming within Section 13 of the Local Government Act, matters associated with the development of hospital work, including the provision of new hospital accommodation the principles underlying the medical and surgical staffing of the hospitals, medical education, and research, and any other matters relating to the work of the municipal and voluntary hospitals in the area Each individual hospital controlled by or associated with the constituent bodies has been invited to approve the constitution and functions of the board, and approval is regarded as indicating acceptance of the principle that the joint board should be consulted whenever the hospital proposes to take any action which relates to the board's terms of reference An executive committee has been appointed to collect and prepare information for submission to the board, and it has been decided to circulate quarterly reports of the activities of the joint board and to issue a full report annually Annual meetings of the board are to be arranged to which the members of the councils, committees or boards of management of the various constituent bodies will be invited

Consultant Service

One of the most important questions that the joint board has dealt with during its first year of work is the provision of a regular consultant service for the municipal hospitals Hitherto patients in municipal hospitals received treatment by a specialist only when consultation was considered desirable by the resident medical officer, but, even for this limited service, the number of specialists available and the number of visits paid by them were insufficient It has now been decided to appoint six consultants—two in medicine two in surgery, and two in midwifery—who will pay regular visits to certain municipal hospitals, and who will be actually responsible for the diagnosis and treatment of all acutely ill cases Each patient will be seen by a

paroxysmal tachycardia and the accelerations of cardiac rhythm associated with morbid conditions in the heart and endocrine glands Among therapeutic measures in paroxysmal tachycardia are mentioned the well known reflex methods of slowing the heart, such as the compression of the vagus and the oculo cardiac reflex Reference is made to the induction of vomiting by ipecacuanha, and to the risky use of apomorphine in this connexion In spite of its theoretical disadvantage in inhibiting the vagus atropine is accorded a place in the therapeutic armamentarium Hochrein is quoted as advising the oral administration of atropine in doses sufficient to produce dryness of the mouth This measure is said to reduce the frequency and severity of bouts of paroxysmal tachycardia Dr Clerc writes in a more dispassionate vein than the authors of *Les Nevroses Tachycardiques* but since he focuses attention chiefly upon treatment and since the tachycardias are notoriously refractory to therapeutic measures, this is, perhaps, not surprising

QUEEN CHARLOTTE'S MIDWIFERY

The Queen Charlotte's Textbook of Obstetrics By Members of the Clinical Staff of the Hospital Fourth edition (Pp 674 291 figures 4 coloured plates 18s) London J and A Churchill 1936

This fourth edition of a highly successful textbook of obstetrics by members of the staff of Queen Charlotte's Hospital appears with eleven names on the title page as having a part in its authorship Since the last issue the staff of the hospital has been increased to eight, and after their names, but separated by the heading with the assistance of ' are three more names

In the preface attention is specially drawn to the recent work of Colebrook from the hospital research laboratory which has been incorporated in the chapter on puerperal sepsis The varieties of this disease are there differentiated by the causative organism and their clinical features contrasted For example those of the haemolytic streptococcus and the anaerobic streptococcus are set out in parallel columns showing that the latter is distinguished by its prolonged course, localized and slowly spreading lesions with multiple abscesses of lung and venous thrombosis common but general peritonitis very rare, while the opposite generally holds in haemolytic infections Staphylococcic infections are usually local and mild, but general septicaemia with metastatic abscesses may develop, in which the mortality rate is high The clinical characteristics of infection by *B coli* and *B welchii* are also noted Full instructions are given for their investigation, including the taking of blood cultures Clinical types are also classified separately as local (that is, confined to the uterus) infections confined more or less to the pelvis and generalized infections Regarding treatment chemotherapy and immunological methods have proved disappointing The danger of intervention particularly curettage is emphasized and early drainage of the pelvis by laparotomy in general peritonitis does not seem to be advocated so strongly as in the previous edition the conclusion being that it is too soon to arrive at a final decision The chapter on Pyrexia in the Puerperium is excellent on both pathological and clinical aspects, and provides a remarkable illustration of the gain to this book by its authors being able to draw on the resources of the hospital, the isolation block and the research laboratories

The high standard of its predecessors in matter and teaching is fully maintained though there seems some falling off in the editorial supervision It is unseemly to admit to a textbook the slang of medical students and nurses, as in a subheading in large clarendon type Diagnosis of a Temperature in the Puerperium and its opening words If a patient develops a temperature also elsewhere we learn that a baby may develop a few degrees of temperature But we have a fellow feeling with the captain of this eleven and the many responsibilities on graver matters he has had to face

TESTICULAR DISEASE

Diseases of the Testicle By Hamilton Bailey F R C S (Pp 166 129 figures 10 coloured 12s 6d net) London H K Lewis and Co 1936

Mr Hamilton Bailey has compressed within the compass of a little more than 150 pages all that it is essential for the student and practitioner to know of the subject Like other books by the same author this volume is clearly written and very well illustrated even the smallest manœuvre being thought worthy of a drawing The teaching in the book is thoroughly up to date and there is a useful list of references to original articles given at the end of each chapter An unusual feature is the absence of an author's preface

The opening chapter deals briefly with the anatomical and physiological aspects of the descent of the testicle and is followed by five chapters upon imperfect descent and its treatment Here there is a short account of the modern endocrine therapy of delayed descent although insufficient emphasis is laid upon the difference between unilateral and bilateral cases in their aetiology and their response to this treatment The operative treatment by various types of orchiopexy (which title is used following Torek, instead of the more usual orchidopexy) is fully described, the author's preference is for the use of a temporary internal wire splint The next two chapters are devoted to a brief account of the normal anatomy and of the methods of examination of the testicle In the rest of the book such conditions as hydroceles torsion inflammatory lesions and new growths are adequately and concisely dealt with In the case of neoplasms of the testicle the new hormonal test is described and the hope is expressed that its use may lead to earlier diagnosis and treatment

Not the least interesting is the final chapter upon rejuvenation, in which there is a brief description of the Steinach operations and of testicular grafting As the author wisely comments however, 'there has been a tendency for these operations to be performed by a type of practitioner who is not above advertising to the lay public, and rejuvenation is a subject which *lends itself to* arresting newspaper copy The book is exceedingly well produced and the publishers are to be congratulated upon the quality of the paper and the excellence of the reproductions whether line half-tone or coloured

PROGRESS IN PHYSIOLOGY

Evans Recent Advances in Physiology Fifth edition revised by W H Newton M D M Sc (Pp 600 120 figures 10s) London J and A Churchill 1936

The task of bringing up to date a volume devoted to recent advances is one calling for certain qualities of ruthlessness For the reviser must be prepared to subject the work to a considerable process of metamorphosis and in many ways to change the whole content and the approach to the various matters raised In submitting his book to revision by a younger mind Professor Lovatt Evans has shown praiseworthy judgement and the highest praise we can offer to Dr Newton is that his work is worthy of the original editions It is easy, and too often the practice

hospitals named above, and the medical officer of health to each of the local authorities in the area The board will have power to co-opt not more than seven persons possessing special experience and qualifications, and to invite other bodies to send representatives

Functions of the Board

The functions of the board are to consider proposals concerning the co ordination or extension of hospital services in the area, and questions relating to institutional and clinical medical services to consult statutory authorities on the development of institutional, clinical, and research services, to organize collective efforts for the raising of funds to provide and maintain hospital and clinical services, and to distribute the income derived from special appeals or other sums collected through the agency of the board The board will hold an annual general meeting and not less than two other meetings during the year Business during the intervals between meetings of the board will be conducted by an executive committee, which will appoint special subcommittees, with or without power to co-opt additional members, to consider particular questions The financial aspect of the hospital service is to be delegated to a special appeals and voluntary subscriptions department the duties of which will include the collection of individual subscriptions on behalf of the associated hospitals, the organization of special appeals for funds, and the arrangement of propaganda in co-operation with local statutory authorities and voluntary health and social service organizations

Financial Considerations

The promoters of the Oxford scheme emphasize the necessity of retaining the voluntary principle in the local hospital service, and it is for this reason that prominence is given to the financial aspect It is stated that the present voluntary hospital accommodation, with certain extensions, is adequate to meet local requirements so long as the local authorities can supply accommodation for the institutional nursing of aged and chronic cases, and provided that clinical services are established by co-operation between the voluntary hospitals and the local authorities To develop and maintain an adequate and efficient service on these lines would necessitate an increase in the aggregate income of the voluntary hospitals of about £7,000 a year, and it is hoped that the work of the Joint Hospitals Board will result in the collection of this increased income and in the introduction of considerable financial economies It is suggested that existing contributory schemes and provident associations, while retaining their autonomy, should become affiliated to the joint board and co-operate closely with other bodies responsible for securing financial support for local institutional services

Conclusion

It will be seen that the Manchester and Oxford schemes offer in different ways methods of co-ordination and co-operation which are capable of imitation or adaptation in many other parts of the country, and Branches and Divisions of the Association may find in the account given above suggestions that will provide a basis for discussion with the appropriate authorities in their own

Hospital co-ordination promises to become one the most prominent questions in the medical world ig the next few years, and the association of the local nized profession with any projected scheme should be aluable to all the interests concerned

PROBLEMS IN PRACTICE

(These columns are devoted to matters of general interest on which individual members have sought the advice of the Head Office of the British Medical Association)

ASSISTANTSHIPS

An assistant is in honour bound to do his best in the interests of his employer, not only in the conduct of the practice, but in the maintenance of satisfactory relations with other members of the profession in the neighbourhood It is the business of an assistant to make his own terms upon engagement, and he will probably be required by the principal to enter into a bond or undertaking not to begin practice for himself within a certain radius for a certain specified time In any bond concerning a principal and an assistant it is advisable to include the following conditions

(i) The assistant to give diligent and faithful service

(ii) The assistant to give his whole time and attention to the practice under the direction of the principal

(iii) The assistant to receive from the principal periodic payment for his services at an agreed rate

(iv) The assistant to keep just accounts and pay over to the principal all moneys received on behalf of the practice

(v) Provision for a holiday for the assistant

(vi) Provision for the determination of the agreement

(vii) Period for the duration of the agreement

(viii) A restrictive clause as to practice by the assistant during and after termination of the agreement

(ix) A provision that both the principal and the assistant should be members of one of the medical defence societies during the whole period covered by the agreement, and also one for the settlement of disputes by arbitration

(x) That if the assistant's name is placed upon the medical list of the National Health Insurance Committee the assistant must agree that either the assistant shall not accept any insured person other than in the name of and on behalf of the principal or if any insured persons are accepted in the name of the assistant he shall take every possible means to ensure the transfer of those persons to the list of the principal on the termination of the agreement

The assistant for his own protection, should insist that the bond be drawn up by a solicitor with experience of the legal pitfalls of medical practice An assistant has no right or claim to any fees or emoluments for any work connected with the practice unless some special provision has been made therefor or unless such work—for example evidence given in a court of law—arises after the termination of the assistantship An assistant is liable to instant dismissal for neglect of duty, gross misconduct, incompetence, absence without leave, or disobedience to reasonable and legitimate directions If, however an assistant is dismissed wrongfully the whole covenant between him and his principal is nullified and he is therefore no longer legally bound to refrain from competing with his principal in practice Whether he elects to take advantage of this freedom is an ethical consideration and must depend on circumstances He should not do so without consulting the Association and his legal adviser

An assistant who is remunerated by receiving a share of the profits has the right of access to his employer's accounts and books, although he has none of the other rights of a partner

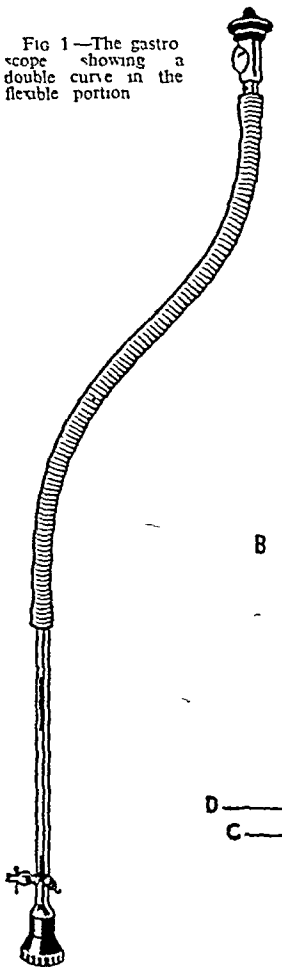
Although the principal is responsible for the consequences of any act of his assistant performed in the course of his employment and duty the assistant, by reason of the fact that he is registered, is also responsible

Preparations and Appliances

A FLEXIBLE GASTROSCOPE

Mr KENNETH HERITAGE M S F R C S (London W 1) writes Using a new optical system devised by Gunther Loeck an entirely new flexible gastroscope has been constructed for which the following advantages are claimed (1) a greater degree of flexibility than that hitherto achieved without loss of image, (2) the flexibility is graduated (3) the distal or gastric end can be easily deflected by contact with resistance —the instrument can therefore follow the curve of the stomach with greater ease and the pylorus can be approached more closely, (4) the instrument may be bent in a slight double curve as shown in the illustration without loss of image, (5) this new optical system is constructed to transmit the greatest possible amount of light this is apparent from the size of the exit pupil

FIG 1—The gastroscope showing a double curve in the flexible portion



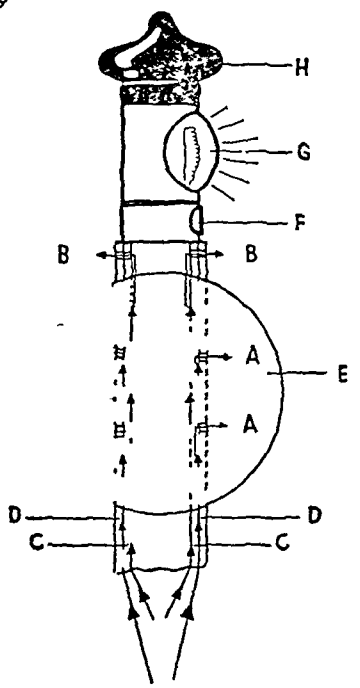


FIG 2—Diagram showing the distal or gastric end of the instrument A = apertures for air to balloon B = apertures for air to stomach C = first rubber tube D = outside rubber tube E = inflated balloon F = viewing window G = lamp H = rubber tip

The optical system consists of numerous lenses in close succession in which the diameter of the image is first reduced to a much smaller size than the diameter of the lenses This tiny image is reproduced by certain reversals and continues in this reduced form through the flexible portion of the instrument until it is ultimately enlarged for visual inspection This optical construction reproduces a picture that is actually swimming in a larger light circle The light thus transmitted is of sufficient magnitude to be adequate for all purposes both when the instrument is flexed and when close proximity to the object results in great magnification A circular picture is obtained even when a double bend in opposite directions is present.

The gastroscope has an overall length of 750 mm with a diameter of 11 mm corresponding to a size of 33 Charriere The flexible part consists of a specially constructed tube graduated in flexibility so that the distal part of the tube is the most pliable part This extremity carries the viewing window the lamp and a large rubber tip to act as a buffer facilitating introduction and to protect the window from oesophageal mucus Using a plane viewing window an angle of vision of 90 degrees is obtained When fully flexed the viewing window subtends an angle of 75 degrees with the rigid portion of the shaft. Thus a very wide range of deviation is compatible with good vision At a distance of 10 cm the magnification is × 1 On the proximal side of the viewing window a rubber balloon is incorporated This is inflatable after passage of the instrument, and serves to lift the viewing window from contact with the lesser curve or cardia and so give a view which would otherwise be difficult

The experimental work and the construction of the instrument have been carried out by the British Cystoscope Company London E C 1

MILTON ANTISEPTIC FLUID

Milton antiseptic fluid has long been known as an effective and convenient preparation suitable for a wide variety of uses The manufacturers have issued a series of leaflets describing the antiseptic properties of milton These include reports from their own laboratories on its chemical composition and bactericidal potency together with independent reports prepared by various authorities These deal with problems such as the action of the fluid on dentures and its efficacy as a disinfectant mouth wash Milton Proprietary Ltd have also succeeded in incorporating milton fluid in an ointment a difficult pharmaceutical achievement which they state occupied five years of research work.

CALCIUM ASPIRIN

Stabilized calcium aspirin (genasprin brand of calcium acetyl salicylate) represents a triumph over considerable pharmaceutical difficulties Calcium acetylsalicylate was found to possess certain important therapeutic advantages over acetyl salicylic acid but unfortunately it proved very difficult to prepare in a stable condition and instability resulted in the liberation of free acetic and salicylic acids The manufacturers (Genatosan Ltd Loughborough) have now succeeded in preparing the drug in a stable form and also in producing it in tablets The numerous therapeutic uses of calcium aspirin are described in a pamphlet prepared by the manufacturers

STREPTOCIDE

Streptocide (Evans Sons Lescher and Webb Ltd) is a preparation of *p* aminobenzenesulphonamide Its history is as follows After many decades of fruitless research the compound named prontosil was discovered to produce a bactericidal action when given by mouth and to be an efficient curative agent in streptococcal septicaemia This important chemotherapeutic advance has since been the subject of intensive research The clinical value of prontosil has been established but it has been proved that the drug is broken down in the body to a simpler compound—namely *p* aminobenzenesulphonamide—and the actions of this substance are now being investigated

The preliminary reports are encouraging but Messrs Evan Sons Lescher and Webb in the brochure accompanying their product point out that the use of *p* aminobenzenesulphonamide is still in its infancy and that the evidence regarding its action is still incomplete Fortunately however the compound has a remarkably low toxicity For example in a 20 gramme mouse protective effects are produced by repeated doses of 2 mg and the lethal dose is about 100 mg. Streptocide is of chief value in the prevention and cure of infection with haemolytic streptococci These organisms are responsible for a remarkably wide variety of human diseases and the drug is recommended as a prophylactic against puerperal septicaemia and for the prevention of complications of scarlet fever streptococcal tonsillitis measles etc The dose recommended is four tablets (0 25 gramme each) by mouth three times a day

by the Council to be equivalent to that paid in respect of insured persons

(c) Persons with a total income from all sources of £250 per annum or upwards, or the dependants of any such persons not to be treated under contract terms

The Representative Body, however, realized that the circumstances of some areas justified a modification of the above conditions, and agreed that in such circumstances the approval of the Council might be given provisionally to a scheme involving other payments, or different income limits, when the local profession could show that this was demanded by the conditions in the area When such schemes containing lower rates of payment were approved it was laid down that the rules should include, in a prominent position, a statement that this approval had been given only on account of the special economic conditions then prevailing

A preliminary examination of the memorandum prepared by the Medical Secretary made it evident to the subcommittee that the time had arrived for the formulation of further principles in relation to contract practice arrangements over and above those just stated in the resolutions of the Representative Body, more especially as the formation of public medical services is proceeding apace The subcommittee considered that it was desirable to correlate so far as possible contract practice arrangements, whether provided through a public medical service or not, and it reported in this sense to the parent committee

Recommendations

After some discussion the committee arrived at the following conclusions and recommendations

1 That it is desirable that in all contract practice arrangements the content of the medical service to be provided should be that laid down by the Association in its model Public Medical Service Scheme

2 That wherever practicable private clubs should be replaced by public medical services

3 That if and when practicable works and colliery contract arrangements should be replaced by an organization such as the public medical service

4 That in the case of adult and juvenile members of friendly societies the arrangements for the provision of medical service provided by these societies should be through a public medical service or an organization similarly constituted

It was also the view of the subcommittee that the time had come for the Medico-Political Committee to decide whether or not there should be any differentiation between the contract rates for attendance upon juveniles as distinct from attendance upon adults In 1928 the Annual Representative Meeting passed a resolution under which a fee of not less than 8s 8d might be agreed to by Divisions at their option for contract practice work for juveniles, but it was not carried by the necessary two-thirds majority, therefore did not technically become a decision of the iation The view of the subcommittee was that the ee of medical attendance which might be required for juveniles was certainly not less—on balance it might well be more—than that required by adults

This was endorsed by the full committee—namely, that ere should be no differentiation in the contract rates for iedical attendance upon juveniles and upon adults, and he recommendation went forward that the resolution of 1928 should be rescinded As a result of this decision the subcommittee will proceed to give detailed consideration to the Medical Secretary's survey and urge the Divisions to take appropriate action

Works Medical Officers

The other matter which engaged the lengthy attention of the Medico-Political Committee was the draft ethical rules for industrial medical officers In the course of the discussion it was stated that there was a definite feeling in the country that the after-treatment of injuries was not as good as it might be, owing to the fact that facilities were not available for the proper carrying out of practitioners' instructions A point to bear in mind was that the works paying compensation, either directly or through insurance companies, had a right to see that proper after treatment was carried out To ensure this, and to save the payment of large sums in compensation, and also to avoid having to keep key men off work for longer than was absolutely necessary, many firms are prepared to employ a works medical officer and also to provide facilities for the proper carrying out of treatment

The proposed ethical code for the guidance of industrial medical officers in carrying out their functions includes clauses to the effect that the industrial medical officer shall not, except in certain prescribed instances, provide treatment in cases of disability, and that such treatment shall be given only with the consent of the worker No undue pressure or persuasion shall be used to influence the worker to undergo treatment at the works clinic Further, "except where there is an *ad hoc* agreement with the worker's own practitioner or an understanding with the Local Medical Committee, treatment shall be given only as set out in the draft ethical rules"

This last clause gave rise to much discussion and many suggestions for amendment It was suggested that in place of the Local Medical Committee there should be two alternatives—namely, the local Division of the British Medical Association, or a group of practitioners in the area concerned On the other hand, in favour of the use of the Local Medical Committee in this connexion, it was argued that the works medical officer was concerned almost entirely with insured persons, and thus was going to encroach chiefly on the work of the insurance practitioner, also that if the Association was to have any say in this matter after the issue of the rules it should be through insurance practice channels—that is, Panel Committees, the Insurance Acts Committee, and the Panel Conference It was the view of some members that to bring the matter before the Divisions would cause much duplication and might create a precedent whereby other matters concerning insurance practice would come to be dealt with by the Division instead of by the Panel Committee

On the other hand it was pointed out that the Council and Representative Body endeavoured to protect the interests of general practitioners as a whole, including, of course, insurance practitioners They had dealt with the subject of encroachments, although this to a large extent was the concern of insurance practice It would create a precedent and be a revolution if the Representative Body in a case of this kind were expected to approve an agreement providing for consultation with an outside organization

Ultimately the draft rules together with the ethical code were, with certain amendments, approved for submission to the Ethical Committee The clause which had been the subject of most of the discussion was amended to read

Except where there is an *ad hoc* agreement with the worker's own practitioner or an understanding with a com

mortem was too much the aim of recent medicine, as if treatment were only a concession to the demands and prejudices of the public In future use must be made of all the lessons of empiricism, even methods at present outside the pale of classical therapeutics are to be explored, and if found helpful brought into use There is to be a revival of research into methods of treatment, and collaboration between teachers of medicine and surgery and the staffs of the hospital services, with veterinarians, with the health officers and family physicians The author urges the foundation of an institute of therapeutics which shall control and investigate not only the traditional and empirical measures but even explore what is valuable in charlatanism Amid much overstatement Delore has produced a stimulating book, one that deserves consideration because of its enthusiasm for the progress of medicine and the good of mankind His underlying hope is to bring about a synthesis which will advance the science of man

THERAPIA STERILISANS MAGNA

Sterilization of the blood stream by chemical means has been looked upon more and more as an unattainable ideal Many procedures undertaken with this object in the not far distant past are now recognized to have been futile Indeed it is difficult to account for the optimism which allowed the intravenous injection of eusol, and although salts and compounds of mercury are not quite so obviously unsuited to this use abundant proof has been available for years that they are powerless to kill bacteria under such conditions These are by no means the only supposed remedies for septicaemia which have 'had their day and ceased to be" and hence there must have been reservations in many minds when it was announced last year that a dye compound synthesized in the Bayer laboratories had been found bactericidal for haemolytic streptococci *in vivo*[1] The earlier phases of work with prontosil have been described in these columns[2] and we need only recall here that the compound was found by a number of workers to be capable of curing experimental streptococcal infection in mice although its bactericidal action *in vivo* was negligible its mode of action was therefore unexplained A steady stream of clinical reports mainly from Germany but including one of considerable weight from this country also testified to its efficacy in the human subject Two further papers which have now appeared carry this research an important stage further Colebrook and Kenny[3] add to their previous series of cases of puerperal sepsis a further twenty six treated by prontosil with not a single death although six were septicaemic A more striking tribute to the value of this form of treatment is not conceivable and the fact that the mortality of the disease shows signs of a spontaneous decline although interesting and welcome in itself in so far as it can be accepted as true does not invalidate the obvious conclusion from so notable a success The investigations of Colebrook Buttle and O'Meara[4] are of equal interest from a different standpoint in that they promise to transfer this treatment from a purely empirical to a rational basis

It was suggested some time ago by Trefouel Nitti, and Bovet[5] that prontosil does not act in the body as such but is converted into another compound para amidobenzene sulphonamide[6] Buttle and his colleagues acting on this assumption have found that this compound has unique bactericidal properties being capable in enormous dilution of killing streptococci in blood provided that the number of bacteria in the mixture is small, as, of course it is in the clinical condition of septicaemia We believe this to be the first occasion on which any germicide has been proved capable of killing bacteria in blood in a concentration attainable in the blood of a patient If the obvious interpretation of these experiments is accepted the forty year-old ideal of "therapia sterilisans magna" so far from receding into the domain of medical mythology, has at one step taken its place as a concrete fact of daily practice It remains to be seen whether "sulphonamide" possesses the therapeutic powers which these experiments and reasoning suggest it may prove superior to prontosil itself and it has the extraordinary feature in a remedy of this kind and one which will encourage its free employment of being administrable only by the mouth It also remains for surgeons and physicians in this country as well as obstetricians to make their own observations on its value in the treatment of streptococcal infections in general So far the studies of puerperal fever in the isolation wards of Queen Charlotte's Hospital have been the only reported attempts in England to evaluate this treatment on an adequate scale Although the opportunities there are admittedly exceptional it should be possible elsewhere to study its effect on a sufficient series of cases of surgical sepsis and throat infections scarlatinal or otherwise offer an abundance of clinical material Lastly there are indications that other bacteria may be susceptible to the action of this remedy These certainly do not include either the pneumococcus or streptococci other than *S pyogenes* but reports of cures of

Proposed Delhi Branch

Notice is hereby given by the Council of the Association to all concerned of a proposal made by members of the Association resident in the Province of Delhi that a Delhi Branch be formed, of area coterminous with that Province

Any member affected by the proposal and objecting thereto is requested to write to the Medical Secretary by April 9, 1937, stating the objection and the ground therefor

CHARLES HILL,
Deputy Medical Secretary

January 9, 1937

Proposed North-West Frontier Province Branch

Notice is hereby given by the Council of the Association to all concerned of a proposal made by members of the Association resident in the North West Frontier Province that a North-West Frontier Province Branch be formed of area coterminous with that province

Any member affected by the proposal and objecting thereto is requested to write to the Medical Secretary by April 9, 1937, stating the objection and the ground therefor

CHARLES HILL,
Deputy Medical Secretary

January 9 1937

Proposed Sind Branch

Notice is hereby given by the Council of the Association to all concerned of a proposal made by members of the Association resident in the Province of Sind that a Sind Branch be formed, of area coterminous with that Province

Any member affected by the proposal and objecting thereto is requested to write to the Medical Secretary by April 9, 1937, stating the objection and the ground therefor

CHARLES HILL,
Deputy Medical Secretary

January 9, 1937

Radiologists Group

A meeting of the recently formed Radiologists Group of the Association will be held at B M A House, Tavistock Square, W C 1, on Friday, January 15, 1937, at 5 p m The Group consists of all those members of the Association who are engaged predominantly in the practice of radiology The agenda will consist of (*a*) the election of a Chairman, (*b*) the election of a Group Committee of six, and (*c*) a general discussion on the work of the Group

CHARLES HILL,
Deputy Medical Secretary

Branch and Division Meetings to be Held

ABERDEEN BRANCH CITY OF ABERDEEN DIVISION—At 29, King Street, Aberdeen, Thursday, January 21, 8 30 p m B M A Film of World Tour, 1935

DORSET AND WEST HANTS BRANCH WEST DORSET DIVISION—At King's Arms Hotel Dorchester, Wednesday January 20 7 30 p m, Supper, 8 30 p m, Address on The Present Position of Chemical Warfare'

EAST YORKSHIRE BRANCH—Wednesday, January 13 President's address

GLASGOW AND WEST OF SCOTLAND BRANCH AYRSHIRE DIVISION—At Ayr County Hospital, Thursday, January 14 Dr J H Paul Tuberculous Spondylitis

HERTFORDSHIRE BRANCH BARNET DIVISION—At Welland House New Barnet, Tuesday, January 12, 8 30 p m Dr A F Hurst Origin and Treatment of Diseases of the Alimentary Tract'

HERTFORDSHIRE BRANCH EAST HERTFORDSHIRE DIVISION—At County Hospital Hertford, Thursday January 14, 8 30 p m Ten minute papers Members' discussion

LANCASHIRE AND CHESHIRE BRANCH—At Manchester Royal Infirmary, Thursday, January 14 4 p m B M A Lecture by Dr H Crichton Miller Psychotherapy'

LANCASHIRE AND CHESHIRE BRANCH BLACKPOOL DIVISION—At Metropole Hotel Blackpool, Wednesday January 13 Dr Geoffrey Holmes (Harrogate) Spa Treatment' Preceded by dinner at 7 15 p m

LANCASHIRE AND CHESHIRE BRANCH PRESTON DIVISION—Joint meeting with Preston Medico Ethical Society at Preston Royal Infirmary Tuesday January 12, 8 30 p m Professor Henry Cohen (Liverpool) Parkinsonism

LANCASHIRE AND CHESHIRE BRANCH SALFORD DIVISION—At Grand Hotel, Manchester Thursday, January 21, 8 30 p m Reception 9 p m, Dinner dance in aid of medical charities

LANCASHIRE AND CHESHIRE BRANCH WIGAN DIVISION—At Rendezvous Café, Standishgate, Wigan, Tuesday, January 12 8 30 p m Dr Norman B Capon (Liverpool) 'Recent Advances in Children's Diseases

METROPOLITAN COUNTIES BRANCH CITY DIVISION—Joint meeting with North London Medical and Chirurgical Society at Royal Northern Hospital Holloway Road N, Thursday January 14 9 15 p m Dr F W Price Observations on Diagnosis and Treatment in Heart Disease [illegible] ence to Child bearing At Metropolitan [illegible] ad, E, Friday January 15 4 30 p m Mr [illegible] cises

METROPOLITAN COUNTIES BRANCH HAMPSTEAD DIVISION—At Hampstead General Hospital, Thursday, January 14 8 15 p m Mr Maxwell P Ellis The Laryngeal Cold

NORTH OF ENGLAND BRANCH MORPETH DIVISION—At Grand Hotel, Ashington Friday January 15, 8 p m Mr J Collingwood Stewart (Newcastle upon Tyne) Ruptured Cartilages and Osteo arthritis of the Knee joint'

NORTHERN IRELAND BRANCH—At Whitla Medical Institute, College Square North, Belfast Thursday February 4 4 30 p m Wing Commander E J Hodsell and Major H S Blackmore Air Raid Precautions Non members and senior medical students are invited to attend

SOUTH WESTERN BRANCH PLYMOUTH DIVISION—At Goodbody's Café, Plymouth Wednesday, January 13 7 30 p m Supper 8 30 p m Discussion The Common Exanthemata in Domiciliary Cases Isolation Disinfection and Contacts To be opened by Dr T A Hunter followed by Dr T Penson

STAFFORDSHIRE BRANCH WALSALL AND LICHFIELD DIVISION—At Walsall General Hospital, Friday January 15 8 30 p m Mr F G Allan (Birmingham) Clinical demonstration

SURREY BRANCH CROYDON DIVISION—At Croydon General Hospital Tuesday, January 12, 8 30 p m Film on Fractures

SURREY BRANCH KINGSTON ON THAMES DIVISION—At Public Assistance Department, Norbiton Friday, January 15 8 30 p m Colonel G Wallace 'Air Raid Precautions and Anti gas Treatment'

GAS HEATING IN FLUELESS ROOMS

A useful piece of work has been done by an advisory committee appointed by the Royal College of Physicians of London to consider the question of domestic heating by gas This is a controversial subject as well as one of great public importance and although no doubt the gas industry itself could have carried out an equally impartial and scientific investigation it could hardly have avoided the suspicion of bias in other quarters This country is fortunate in having institutions of unchallengable impartiality and authority which are willing to undertake inquiries into subjects of great interest to the community but not exactly within the compass of departmental committees In well-ventilated rooms long experience has shown that gas is a harmless and convenient fuel but the case may be different in rooms in which ventilation is defective Unfortunately many of the new flats and housing estates which appear like magic on the suburban landscape contain at least one flueless room in each dwelling This room is used as a spare bedroom or perhaps as a second sitting room and warmed by gas or electricity The outstanding feature in the report of the advisory committee[1] is an interim condemnation of the flueless room—interim because it is admitted that the problem of ventilation of rooms in ordinary conditions of occupation has never been thoroughly investigated and until there is evidence that satisfactory ventilation can be otherwise obtained the committee feels itself bound to recommend that wherever possible living rooms and bedrooms should be provided with flues Surprise is expressed that in view of the great importance of air change so little precise knowledge is available on the subject of domestic ventilation It is certainly most desirable that extended tests should be carried out on rooms in which the only means of inlet of fresh air and escape of foul is by the opening of door or window This by the way is a matter at present under consideration by the Health Organization of the League of Nations The temperature and degree of movement of air in dwelling houses and secondarily the humidity of the air and the temperature of the surroundings are the principal factors to be considered in the committee's view and the changes in the chemical composition of the air in conditions of normal occupation appear to be within limits of little consequence But in view of the criticisms of flueless gas heaters the effects on comfort and health of varying amounts of the products of combustion of coal gas have been studied in detail In our issue of December 26 (p 1328) there appeared a summary of the investigations and the limits were stated which in the view of the committee the products of combustion—carbon monoxide and sulphur and nitrogen oxides—should not exceed Another point to which the committee gave attention is the possibility often mooted of a chronic form of carbon monoxide poisoning The conclusion reached is that there is no evidence of any definite group of symptoms pointing to such a condition While exposure to very small quantities of carbon monoxide may be capable of causing disagreeable effects at any rate in some people during the period of exposure the available evidence is unconvincing as to the occurrence of any definite group of symptoms which would indicate a chronic form of carbon monoxide poisoning It is interesting to contrast with this finding some work by H G Beck in the United States which was the subject of a note in our last issue (p 27) Evidently there is still a problem to be elucidated With regard to the oxides of sulphur small quantities of which are produced in the normal combustion of coal gas the important thing in the committee's view is the objectionable smell and not their effect upon health and the limit of concentration laid down in the report is at a level at which these oxides would be imperceptible to smell It is believed that smell would be perceptible before any irritation of the respiratory tract was produced But smell is a sense which varies within wider limits than any other among human beings and is the sense peculiarly susceptible to adaptation—that is of diminution or cessation of sensation in spite of the continuance of the stimulus The committee's report will be of great value to the gas industry

TUBERCULOUS MENINGITIS OF BOVINE ORIGIN

Despite the incontrovertible evidence of many observers that infection by the bovine tubercle bacillus can be virulent for human beings there is still some scepticism particularly among farmers A recent communication before the French Academy of Medicine[1] was concerned with an analysis of the type of organism present in 130 examples of tuberculous meningitis studied at the Trousseau Hospital between the years 1932 and 1936 Culture from the cerebro spinal fluid on Loewenstein's medium was made in each case and 121 cultures were of the human type and nine of the bovine type Animal inoculation was used to confirm the cultural characteristics of these bovine cultures This proportion is similar to that described in other countries but an interesting point which came out in a further analysis of the case records was that of the nine children dying from their bovine infection all had been brought up in the country and eight were known to have been given raw cow's milk for the greater part of their lives In the remaining case raw cow's milk had also been taken the father was also stated to be suffering from pulmonary tuberculosis which introduces an element of doubt Of the 121 human cases only 10 per cent. came from the country and there was clearly a human source of infection in most of the cases It was pointed out in the discussion that fatal bovine infection in country districts might well reach a higher incidence than these figures suggest despite the usual custom in France of boiling all milk The figures here given are not large compared with those available in other countries but the subject has been little studied in France from this aspect The communication however serves to clinch the case against raw milk for children in any part of the world

[1] *Bull Acad Med Paris* November 17 1936 p 373

responded by an inflammatory reaction In general it was decided that the response was not due so much to the micro organism as to the reaction of the tissue in question These same eyes were called tuberculous in Vienna and treated with tuberculin, syphilitic in Paris and treated with arsenic, and allergic in England and treated with whole blood injections, with comparable results The lecturer did not confine his remarks to eyes and thus stimulated a lively and interesting discussion, in which many members took part The meeting closed with a hearty vote of thanks to Sir Stewart Duke Elder for his address and to Mrs Hardie for hospitality

KENT BRANCH EAST KENT DIVISION

At a meeting of the East Kent Division, held at Cliftonville on December 17, 1936, Dr F J S HALL delivered a lecture on Cineradiography, which was illustrated by a series of typical cinematograph films made at the Victoria Hospital Deal, where an x-ray cine camera has been in use since 1934 Dr Hall briefly reviewed the technical difficulties encountered, and paid tribute to other workers in this field notably Dr Russell Reynolds whose work with 16 mm film had done so much to standardize the technique with this medium Dr Hall preferred full size 35 mm film for orthopaedic work as a really large screen image could be obtained and the addition of a sound track to demonstration films for first-aid lectures and anatomical classes was facilitated thereby One such film had actually been shown successfully in 1935 to an audience of more than one thousand people and the result left no doubt that joint anatomy could be easily and rapidly taught by this method Films of normal and abnormal joints, heart lung, and barium meal loops were then shown the advantage of a fluorescent screen examination prolonged indefinitely by the aid of a projector impressed all present The members were particularly struck by little realized anatomical points, especially the amazing range of movement of the proximal row of carpal bones in the wrist-joint the importance of scapular rotation in abduction of the shoulder, and the negligible part played by the patella in movements of the knee-joint The rather unexpected range of movement in the cervical spine was very clearly seen

In the discussion which followed Dr Hall asked for criticism and suggestions for the clinical or other applications of this new technique He had used it so far merely to assist his general surgical work, and had found it of some assistance in the diagnosis of obscure joint lesions particularly in difficult cases of 'tennis elbow' It was easy to differentiate between true limitation of movement from bony obstruction and joint stiffness from adhesions by watching a cineradiograph

The chairman Dr W E C WYNN in thanking Dr Hall for his interesting lecture emphasized the pioneer nature of his work and the number of possibilities it seemed to open up

LANCASHIRE AND CHESHIRE BRANCH PRESTON DIVISION

A joint meeting of the Preston Division and the Preston Medico Ethical Society was held at Preston Royal Infirmary on December 15 1936 when a representative of Messrs Evans Biological Institute gave an address on The Preparation and Standardization of Antitoxins and Prophylactics with Special Reference to Diphtheria The speaker's preliminary remarks were chiefly devoted to the various prophylactic preparations for combating diphtheria and the methods of preparation and the advantages of each He then showed an interesting film illustrating his remarks and demonstrating the various activities of the laboratories and the great care with which the preparations are made

LANCASHIRE AND CHESHIRE BRANCH ROCHDALE DIVISION

A meeting of the Rochdale Division was held at Rochdale Infirmary on November 13 1936 when in the absence through illness of the chairman, Dr S WILSON the vice chairman Dr F W MACKICHAN was in the chair

Dr H T ASHBY (Manchester) gave a lecture on Some Common Ailments of Children An interesting and novel feature of the lecture consisted in a break after each subject for questions and discussion This method resulted in bringing into the discussion the majority of the members present Dr Ashby drew attention to the frequency with which birth injuries occurred the most common being oedema of the brain sometimes with severe sequelae As measures for treatment he advised absolute rest hypertonic saline enemata (10 oz to 1 pint) four hourly pipette feeding and in restless cases chloral hydrate (14 grains) four hourly if necessary

Infantile eczema required much care and patience This type of child was more prone to severe illnesses than the normal child The lecturer advocated moderation in the actual treatment of the eczema, the use of olive oil and simple ointments or lotions according to the needs of the case and measures to prevent scratching Overfeeding should be avoided, most of the infants being fat, and he had found allergillac useful

In the treatment of attacks of asthma adrenaline during the spasm and ephedrine or pseudo-ephedrine to avert attacks were the most effective methods Plenty of rest and a simple diet were necessary Eggs and fish were not often exciting factors In hay fever, after establishing the fact that the case was one of true hay fever, desensitization should be begun not later than early February with pollagin Moderate immunity would probably remain in the following year but treatment would be required again in the third year Drs ROBERTSON WILSON JEFFERSON, MILLS, KIPPEN, VALENTINE OLIVER MACMASTER, MACKICHAN DICKSON, PIRRIE, and LOMAS took part in the discussions and in proposing and seconding the vote of thanks Drs WILSON and HEAP voiced the gratitude of the members for one of the most interesting and practical addresses that the Division has enjoyed

MALTA BRANCH

A clinical meeting of the Malta Branch was held at the University on November 6, 1936, when about fifty members including some of the principal officers of the Army and the Navy, were present Professor P P DEBONO read a paper on 'The Surgical Treatment of Pulmonary Tuberculosis' Professor Debono opened by outlining Rankin's theory of the development of tuberculous infection, which divided the disease into three stages—namely, invasion, dissemination, and localization He said that pulmonary tuberculosis was always to be considered as a local manifestation of a general disease and for this reason it was impossible to cure it by lobectomy or pneumonectomy Whatever the treatment adopted due regard must be paid to the general treatment of the patient He said that the best results were being obtained by physicians from collapse therapy by means of artificial pneumothorax but this unfortunately, could not be carried out always on account of the presence of adhesions In these cases collapse might be obtained by surgical procedures Professor Debono gave a historical survey of the development of surgical treatment in pulmonary tuberculosis and passed on to consider the various procedures that might be adopted Localized adhesions, he said, could sometimes be divided through a thoracoscope The dangers of this operation were inherent in the fact that adhesions might carry vessels or processes of infected lung tissue inside them which might give rise to haemorrhage or infection in the pleural cavity Operations on the phrenic nerve were very often carried out mostly on account of their relative simplicity He described the technique of phrenic evulsion At one time, he said phrenicectomy was hailed as a sort of panacea where collapse of the lung was desired, but when the end results of the operation came to be assessed it was found that they did not come up to expectations It was now being realized that the effects of phrenic avulsion were exercised mainly on the base of the lungs and often failed to reach the infected apex because the lung was bound down by adhesions Professor Debono then described apicolysis and thoracoplasty Against apicolysis with plantage he pointed out the liability of the wound to infection on account of the presence of a foreign body and the frequency with which this foreign material was extruded through the wound or through a bronchus He described the technique of the Sauerbruch operation of total thoracoplasty and of the various modifications of selective thoracoplasty that have recently been evolved Not all cases in which pneumothorax failed were suitable for thoracoplasty A careful selection must be made The contralateral lung must be able to bear the extra work that will be thrown on it and the diseased lung must show a certain degree of fibrosis The patient must be strong enough to undergo a major operation Selection of cases must not be too rigid, as otherwise patients might be refused who would have derived benefit from it The number of cases suitable for thoracoplasty has been increased by dividing the operation into two or more stages The operation which was likely to give the best results was a selective apical thoracoplasty combined with extrapleural separation of the apex of the lung The anaesthetic of choice was gas and oxygen which Professor Debono considered superior to the local anaesthesia which was adopted on the Continent A discussion followed in which Professor J E DEBONO Mr A J CRAIG, Dr W GANADO, and Colonel A DAWSON took part

NOTES OF THE WEEK

"Medical Insurance Practice"

Every insurance practitioner will have received a notice of the alterations in his terms of service made under the consolidated regulations which came into force on New Year's Day. The Insurance Acts Committee of the British Medical Association is able to announce that the fourth edition of *Medical Insurance Practice* (Harris and Sack) is in the press and will be on sale in three or four weeks' time, price 2s., post free.

The new volume embodies all the changes in the regulations and procedure which have been made since the third edition was published in 1929. But it does a great deal more than this: a complete revision of the book from cover to cover has been made and the authors—by means of an extensive search of official rulings, semi-official communications, and the records of proceedings of the Insurance Acts Committee—have spared no pains to carry out to the full their expressed intention to avoid leaving unanswered any question arising in the daily insurance work of the busy general practitioner. An extended reference to the new issue is made in the weekly notes on the Insurance Medical Service.

Edinburgh Public Medical Service

Although the second annual report of the Edinburgh Public Medical Service has still to be approved by the annual meeting of members some statistics of the year's work are available. There are now 127 doctors on the medical list, and during the year 1,100 new subscribers joined the service. The sum collected from subscribers was £4,610 1s. 2d. Of this amount 16 per cent. was needed for the cost of drugs, 10 per cent. for the cost of collection, 12 per cent. for the cost of administration, and 62 per cent. was allocated to the Practitioners' Fund for distribution among the members. Last year the amount available for the Practitioners' Fund was 55 per cent. of the total income. Two alterations in the rules were made during the year with the object of reducing the cost of drugs: new members are not now allowed to obtain drugs at the expense of the service until eight weeks after the date of entry, and until eight weeks' subscriptions have been paid, and doctors have been asked not to accept chronic cases unless the patient undertakes to pay the cost of drugs required. The report states that the contribution of friendly societies to the service has lessened. Three leaflets on child welfare have been issued during the year. One gives advice to expectant mothers, the second contains instructions for breast feeding, and the third deals with the feeding of children between 7 and 12 months of age. When the annual meeting of members receives the report for approval it will be asked to agree to certain amendments in the rules for the coming year.

Maternity Service in Cardiff

The Maternity and Child Welfare Subcommittee of the Cardiff City Council recently convened a conference of representatives of organizations including the Cardiff Division of the British Medical Association interested in the midwifery service. The medical officer of health outlined the proposals which the subcommittee intends to submit to the City Council. The scheme includes the employment of thirty midwives and arrangements for co-operation with the Queen's Institute of District Nursing.

A Patient Views His Doctor

For the past twelve years the Metropolitan Counties Branch of the British Medical Association has arranged annually a special address to the fourth and fifth year medical students and recently qualified medical practitioners in the metropolitan area. The 1937 address will be given by Dr. Cyril Norwood, M.A., President of St. John's College, Oxford, who has chosen as his subject The Doctor—as Seen by his Patient. The lecture will be given in the Great Hall of B.M.A. House, Tavistock Square, W.C.1, on Tuesday, March 9, at 5.30 p.m. punctually. Tea will be served at 5 p.m. A personal invitation will be sent at an early date to all concerned, and the invitation card must be produced on admission. Any fourth or fifth year student or recently qualified medical practitioner who may not have received an invitation by March 2 is invited to apply to the honorary secretaries of the Metropolitan Counties Branch at B.M.A.

... University Jacobus Stephanus Marais Memorial ... Scholarship for Research in Surgery Value £450 ...

... Royal Infirmary and the Welsh National School of Medicine Part time Hon Dermatologist, and M O in Charge of Male Venereal Diseases Centre

Chesterfield and North Derbyshire Royal Hospital—H S (male) for the Ophthalmic and Ear, Nose, and Throat Departments Salary £150 p a

Dereham Memorial Hospital—H S (male) for the Casualty and Orthopædic Departments Salary £150 p a

Dewsbury and District General Infirmary—(1) Senior H S (2) Second H S Males Salaries £200 p a and £150 p a respectively

Doncaster Royal Infirmary and Dispensary—(1) R S O (2) Casualty H S (3) Resident Anæsthetist Males Salaries £250 p a £175 p a and £175 p a respectively

Dunedin, New Zealand Otago Hospital Board—Radiotherapist Salary £1 000 p a

Ealing Borough—R A M O (male, unmarried) Salary £350 £25 £550 p a

Eastbourne Princess Alice Hospital—R H S (male) Salary £150 p a

Enfield Urban District Council—Deputy M O H and Assistant School M O (male) Salary £600 £25 £750 p a

Evelina Hospital for Sick Children, Southwark S E—H P (male) Salary £120 p a

French Hospital and Dispensary, Shaftesbury Avenue W C—Hon Gynæcologist with charge of Out patients

Gloucester Gloucestershire Joint Committee for Tuberculosis—J A M O (male) for Standish House Sanatorium, Stonehouse Salary £250 p a

Golden Square Throat, Nose and Ear Hospital, W—H S (male) Salary £100 p a

Grimsby and District Hospital—(1) Senior H S (2) H P Males Salaries £200 p a and £150 p a respectively

Halifax Royal Halifax Infirmary—Third H S (male, unmarried) Salary £150 p a

Hampstead General and North West London Hospital, Haverstock Hill N W—H P (male unmarried) Salary £100 p a

Hastings Royal East Sussex Hospital—J H S (female) Salary £150 p a

Hull Corporation Health Department—J R M O (female unmarried) for Hull Municipal Maternity Home and Infants Hospital Salary £100 p a

India Government—Director of the All India Institute of Hygiene and Public Health Calcutta Salary Rs 1,450 Rs 1 750 per calendar month, plus special pay of Rs 400 per month plus overseas pay of £30 per month

Inverness Royal Northern Infirmary—Hon Visiting S to Ear Nose and Throat Department

Isle of Man Mental Hospital Services—A M O (male) Salary £350 £25 £450 p a

Laboratories of Pathology and Public Health Harley Street, W—Junior Assistant Pathologist (male) Salary £500 £25 £650 p a

Leamington Spa Warneford General Hospital—H P Salary £150 p a

Leeds Public Dispensary and Hospital—Research Worker in Arthritis (male) Salary £300 p a

Leeds University School of Medicine—Readerships in (1) Medicine and (2) Surgery Salaries £600 p a each

Leicester Royal Infirmary—(1) Hon Dental S (2) Two Hon Assistant Dental S s

Lincoln County and Parts of Lindsey—Assistant County M O H Tuberculosis Officer, and School M O Salary £500 £25 £700 p a

Liverpool Bootle General Hospital—(1) H P (2) C O (3) Two H S Salaries £150 p a each

London County Council—(1) Resident Medical Superintendent for Queen Mary's Hospital for Children, Carshalton Salary £1 400 £50 £1 650 p a (2) A M O (Grade I) and (3) A M O (non resident, Grade II) for White Oak Hospital Swanley Females Salaries £350 £25-£425 and £250 p a respectively (4) Temporary Part-time A M O's for School Medical Work Salary £1 10s per session

London Hospital E—Surgical First Assistant and Registrar Salary £300 p a

Lowestoft and North Suffolk Hospital—J H S (male) Salary £120 p a

Luton Bute Hospital—H S (male) Salary £150 p a

Maidstone West Kent General Hospital—H S (male) Salary £175 p a

Manchester Ancoats Hospital—(1) H S Salary £100 p a (2) Assistant Surgical Officer Honorarium 10s 6d per attendance

Manchester City—(1) Part time Consultant Obstetrician and Gynæcologist (male) for Withington Hospital Salary £300 p a (2) R A M O (male) for Monsall Hospital for Infectious Diseases Salary £350 £25 £450 p a (3) R A M O (female) for Booth Hall Hospital Salary £200 p a (4) Medical Practitioner to examine men undergoing training in anti gas measures Fee £1 1s per examination

Manchester Duchess of York Hospital for Babies—Assistant Anæsthetist Honorarium 10s 6d per session

Manchester Hospital for Consumption and Diseases of the Throat and Chest—(1) R M O for Ear Nose and Throat Department St Anne's Home Bowdon (2) A M O for Crossley Sanatorium, Delamere Forest Males Salaries £200 p a each

Manchester Northern Hospital—(1) R H P (2) R H S Salaries £100 p a each

Manchester Royal Infirmary—(1) Four H S (2) Four H P (3) H S for Aural, Gynæcological, and Ophthalmic Departments (4) H S for Neuro surgical Department (5) H S for Orthopædic Department Salaries £50 p a each

Mansfield and District General Hospital—H S (male) Salary £150 p a

Market Drayton Cheshire Joint Sanatorium—R M O (male) Salary £250 p a

Merthyr General Hospital—R H S Salary £150 p a

Metropolitan Hospital, Kingsland Road, E—C O and Resident Anæsthetist (male) Salary £100 p a

National Association for the Prevention of Tuberculosis W C—Secretary General Salary £600 p a

National Temperance Hospital, Hampstead Road, N W—Medical Registrar Honorarium £42

New Zealand Palmerston North Hospital Board—Pathologist (non resident) Salary £900 £50 £1,000 p a

Northumberland County Council Education Committee—Assistant County M O H (male) Salary £500 £25 £700 p a

Oxford Radcliffe Infirmary—H S (male) Salary £120 p a

Oxford University—Nuffield Professorship of (1) Clinical Medicine and (2) Obstetrics and Gynæcology Salaries £2,000 p a each

Plymouth Prince of Wales s Hospital, Devonport—J H S Salary £120 p a

Plymouth Prince of Wales's Hospital, Greenbank Road—H S Salary £120 p a

Preston and County of Lancaster Royal Infirmary—Obstetrical M O Salary £1,000 p a

Queen Charlotte s Maternity Hospital, Marylebone Road, N W—Assistant to the Paediatrician and M O to the Infant Consultation Centre

Rhondda Urban District Council—A M O (female, unmarried) Salary £500 £25 £700 p a

Royal Cancer Hospital (Free), Fulham Road, S W—R M O Salary £200 p a

Royal National Orthopaedic Hospital, Great Portland Street, W—Two H S (males, unmarried) for the Brockley Hill Branch Salaries £150 p a each

Royal Society of Medicine, Wimpole Street, W—Nichols Fellowship Honorarium £150 p a and a grant of £15 for expenses

Rugby Hospital of St Cross—R M O (male) Salary £100 £150 p a

St Albans Hill End Hospital for Mental and Nervous Disorders—Two H P Salaries £165 p a each

Seamen s Hospital Society, Greenwich S E—Resident Medical Superintendent (unmarried) at the Hospital for Tropical Diseases Gordon Street, W C Salary £400 p a

Sheffield City—Assistant Tuberculosis Officer (male, unmarried) for Winter Street Hospital Salary £350 £25 £550 p a

Singapore Municipality, Straits Settlements—Assistant Municipal Health Officer (male, preferably unmarried) Salary $8,400-$9 360 p a

South London Hospital for Women Clapham Common, S W—(1) Surgical Registrar (2) Out-patient M O Half time duties (3) H S Salaries £100 p a each (4) Clinical Assistants to Surgical Out-patients Females

Staffordshire County Council—Assistant County M O H (male) Salary £500 £25 £700 p a

Certifying Factory Surgeons—The following vacant appointments are announced Bourne (Lincolnshire), Bromsgrove (Worcestershire) Gillingham (Dorset) Cranbrook (Kent) Applications to the Chief Inspector of Factories Home Office, Whitehall S W 1, by January 19

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 51 52 53 54 55 56 57 and 60 of our advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 58 and 59

consultant as soon as possible after admission Such a service will improve the status of the municipal hospitals and patients in these hospitals will in future receive the benefit of a consultant and specialist service similar to that previously available only in voluntary hospitals It will also ensure co operation in the matter of medical staffing for the majority of the consultant personnel will serve at both types of hospital they will act as part time paid consultants to the municipal hospitals and as honorary consultants to the voluntary hospitals The board elected an advisory panel to make recommendations for these appointments and the continuance of this panel as a permanent institution is under consideration for it is suggested that its use in connexion with all appointments of consultants at both the voluntary and the municipal hospitals will help co ordination

being collected from the various hospitals in the area on developments of hospital work or accommodation which are to be undertaken during the next two years and the joint board hopes to be able to secure a measure of co ordination or unification in the extended service The use of hospitals in the event of air raids has been considered in much detail and a subcommittee has been appointed to discuss with representatives of the British Red Cross Society the St John Ambulance Association and the military authorities the scheme prepared by the City Council It is proposed that voluntary hospitals in the centre of the city shall be regarded as casualty clearing stations and certain municipal hospitals as base hospitals for the accommodation of persons requiring continued treatment Other parts of the scheme concern the provision of instruction in precautionary measures

CO-ORDINATION OF MEDICAL SERVICES—OXFORD AND DISTRICT

Medical Directors

Another innovation is the appointment, for an experimental period of two years of a director of services in each of the three main branches—medicine surgery and gynaecology These directors are practitioners possessing high qualifications and wide experience, who will visit the hospitals regularly and discuss with the visiting staffs and the medical officer of health questions affecting the development and co ordination of hospital services in their respective spheres Their advice will be available when special units are being formed, and they will encourage and supervise research The appointment of distinguished practitioners to these offices should ensure the fullest co operation between the voluntary hospitals the municipal hospitals, and the University

Although the reorganization of the consultant service for municipal hospitals has been the most extensive work of the joint board during the year many other questions are under consideration One is the unification of the orthopaedic services which is being considered in the light of the report of the B M A Committee on Fractures and another is the reduction of waiting lists Information is

The Oxford Scheme

The Oxford scheme here represented has only recently been inaugurated and has not yet begun its activities Like the Manchester Joint Board the Oxford and District Joint Hospitals Board will be concerned with the co ordination of hospital services and will also deal with the raising of funds Another feature of the Oxford scheme is the direct representation of the local Branch of the British Medical Association on the joint board The personnel of the Oxford Joint Board is larger than that in Manchester A prescribed number of members are to be nominated by each of the following bodies the Radcliffe Infirmary the Wingfield Morris Hospital the Oxford Eye Hospital the Horton General Infirmary and other associated voluntary hospitals in the area the Oxford City Council and the Oxfordshire County Council the contributory schemes and provident associations operating in the area the University of Oxford and the Oxford University Medical School and the Berks Bucks and Oxford Branch of the British Medical Association The membership will include also a member of the honorary medical staff of each of the

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

CLINICAL ASPECTS OF HYPERTHYROIDISM

BY

F. R. FRASER, M.D., F.R.C.P.

AND

SIR THOMAS DUNHILL, K.C.V.O., M.D.

Hyperthyroidism or toxic goitre may arise in a patient who has shown no signs of thyroid disease previously or in one who for many years has had a simple goitre. It is more common in females than in males and may occur at any age, but the incidence is greatest in women in the third decade and at the time of the menopause.

Course of Disease

The disease is usually chronic, partial remissions and periods of increased activity alternating irregularly, rarely the course is short, the condition lasting for a few months and ending in spontaneous recovery. The initial attack or any relapse may be so severe as to cause death, and, if the condition is chronic, auricular fibrillation and congestive heart failure or mental disturbances are likely to develop eventually.

Actiology

The cause is unknown, but infections such as influenza or acute tonsillitis, psychic stresses such as emotional shocks and financial or family worries, and events of the sex life such as adolescence and the menopause, are so frequently associated with the onset or a relapse that they are regarded as exciting causes. In many cases no exciting cause can be found. A constitutional factor also is probable.

Clinical Picture and Diagnosis

The clinical picture is extremely variable. The symptoms and signs include enlargement of the thyroid gland, muscular weakness, mental irritability, physical and mental restlessness, tremor, palpitation and tachycardia, excessive flushing and sweating, loss of weight, and eye signs of which the most striking are exophthalmos and widening of the palpebral fissures. All or only a few of these disturbances may be present, and any one of them may be absent. The most constant departure from the normal is the increased rate of basal metabolism, but in mild cases the figures are difficult to assess, and when the increase is definite the clinical features are usually well marked. The estimation of the basal metabolic rate is therefore unnecessary for diagnosis.

The typical clinical picture of exophthalmic goitre in which all the symptoms and signs are present is most frequently seen in women during the child-bearing age, in older patients, and when the condition arises in the course of a long-standing simple goitre, the signs may be few and the picture may be predominantly that of a functional failure of some organ such as the heart or of the mental faculties. When auricular fibrillation results in an elderly patient the signs and symptoms of congestive heart failure may be so pronounced that the underlying cause is missed, a slight enlargement of the thyroid gland and an absence of any other cause for the cardiac irregularity being the only clues to the diagnosis. If a thyroid origin is considered, however, other evidence is usually forthcoming in a slight widening of the palpebral fissures, tremor, or a history of goitre, simple or toxic, earlier in life.

A mild degree of hyperthyroidism is sometimes seen in patients who have suffered for years from neurasthenia and indefinite symptoms of ill-health. A slight enlargement of the gland and the nervous manifestations of hyperthyroidism are present, with or without tachycardia, and as a rule no loss of weight. This is an important group, for the thyroid disturbance is but a part of a more general departure from health which has existed for some time. It is of great importance to assess accurately the part that the thyroid gland is contributing to the disability, for treatment directed to the thyroid alone will give disappointing results, and thyroidectomy may make the condition worse and give rise to mental depression, rendering the life of the patient more unhappy than before.

Condition of the Gland

In the absence of previous disease of the thyroid gland the enlargement is characteristically moderate or slight and affects the gland diffusely. Sometimes it affects the isthmus or one lobe or a portion of a lobe more than the rest of the gland, but the whole is involved. It is firm but not hard, and the surface may not be quite smooth, slight palpable irregularities being due to exaggeration of the normal lobulation. In severe and early cases excessive vascularity is recognized by a palpable thrill and loud systolic murmur. In cases of some duration, or after the administration of iodine, the excessive vascularity disappears and the gland becomes harder and more irregular. If the disease arises in a case of long-standing colloid or simple nodular goitre the gland may be large and irregular. The gross irregularities are due to involution nodules, rarely a "foetal adenoma," usually single, is associated with hyperthyroidism. In older patients it may occasionally prove difficult to determine any enlargement of the gland, which is small and fibrous, but on surgical exposure it is always found to be larger than clinical examination disclosed.

Muscular Weakness and Tremor

Muscular weakness and excessive fatigue on exertion are probably the most constant symptoms. Mental restlessness is usually the symptom first noted by relatives, and is characterized by excessive mental energy and irritability, with periods of depression. The tremor is best seen in the outstretched fingers, and is typically fine and irregular. It may be present also in the lips and tongue, and, in severe cases, affects all the muscles of the body. It may be coarser and more obviously irregular. In many patients there is a physical restlessness so that they cannot sit still and are continually altering the position of their limbs.

State of the Heart

The cardiovascular system is characteristically affected, and the dangers to efficiency and to life are mainly due to this. Palpitation may be the earliest symptom, and in

in law for his own acts Consequently any aggrieved party may bring an action against either the principal or the assistant or against both of them An assistant is usually engaged over a period of one year and is paid monthly where the latter arrangement obtains an assistant is required to give and is entitled to receive 1 months notice to terminate the contract Even in the absence of a restrictive bond it may be taken as a general rule that no assistant should settle in the area of a former principal's practice unless with the written consent of the principal or his accredited representative

INSURANCE MEDICAL SERVICE WEEK BY WEEK

NEW MEDICAL BENEFIT REGULATIONS

On New Years Day the Consolidated Medical Benefit Regulations came into operation These regulations which have been in course of preparation for two years embody many changes apart from the consolidation of the earlier regulations It is therefore essential that every insurance practitioner should acquaint himself with those matters affecting his terms of service which are now set out in the official document This might well occasion something like dismay in the mind of every doctor especially at this busy season of the year were it not for the fact that the invaluable handbook *Medical Insurance Practice* (Harris and Sick) goes to press with a fourth edition concurrently with the appearance of the new regulations It is well that the British Medical Association has decided to publish this book at the nominal price of two shillings because this should ensure that every insurance practitioner—and it is to the practitioner that the book is primarily addressed—should become possessed of the new edition So many extensive changes have been made in the practitioners terms of service and in the administrative procedure since 1929 that copies of the third edition which was published in that year must be scrapped

The authors fairly claim not only to have incorporated all these changes in the book but to have made an extensive review of the whole subject from beginning to end in an endeavour to answer the innumerable questions which present themselves from time to time to the busy insurance practitioner It is not too much to say that if any practitioner attempts to run his insurance practice without a copy of this book in his possession he is working with one hand tied behind his back At the same time the book apart from its dark green cover will present a familiar appearance to those who have been accustomed to the earlier edition The headings to the chapters and the general arrangement of the book remain undisturbed the number of appendices remains the same although several of the earlier appendices have been dropped and new ones inserted The whole of the text of the regulations so far as they affect insurance practitioners the terms of service and the certification rules are of course set out as before

Index to "Medical Insurance Practice"

It is essential that a book of this character should have a very complete index it is most irritating to have to turn up a variety of headings before you find what you want We have nothing but *admiration for the zeal which* has been shown by the authors in compiling the remarkable index which appears at the end of this book The index runs into nearly fifty columns of print and it is perhaps worth while quoting one short section in order to give some indication of its character Here is the section with the heading Scope of Treatment and it is hardly necessary to say that all the subheadings will also be found elsewhere in the index

The book is as before pleasant to handle and is easily read as it is written largely in the second person tone no less have been avoided In order to avoid digressions frequent marginal references are made to page numbers where will be found the main discussion of a subject or a particular branch of a subject mentioned only incidentally or in general terms at the place where the reference is given The book is in the press and will be issued in the course of four weeks time and the Chairman of the Insurance Acts Committee commends the book as his predecessor did the earlier edition to every insurance practitioner

CONTRACT PRACTICE ARRANGEMENTS

Two principal matters engaged the attention of the Medico Political Committee of the British Medical Association in a long sitting on December 30th under the chairmanship of Dr J W Bone They arose out of reports from two subcommittees recently set up one to consider the arrangements for contract practice and the other the ethical rules for industrial medical officers

The report of the Contract Practice Subcommittee whose chairman is Dr H W Pooler was occupied with the additional principles which might with advantage be adopted by the Association in connexion with contract practice arrangements The Medical Secretary recently made a special effort to obtain through the Divisions full details of existing arrangements and as a result a survey was prepared which it was estimated covered at least 90 per cent of such arrangements obtaining in England and Wales It was noted with concern that in many instances especially as regards contracts for attendance upon juvenile members of friendly societies [illegible] being accepted which are below the minimum laid down by the Association

The Associations present policy as regards contract practice is embodied in a resolution of the Annual Representative Meeting of 1920 amended by a resolution passed at the meeting of last year These decisions lay down the following principles

(*a*) Free choice of doctor by patient and of patient by doctor
(*b*) Remuneration to be not less than that which is deemed

for those in which an early return to working efficiency is essential, but in the mildest cases and in those in which the thyroid disturbance is but an incident in a long history of neurasthenia and ill-health it should be tried In older patients and in those with nodular goitre the likelihood of recovery without operation is less, and operative treatment should not be delayed

The tonsils commonly are moderately enlarged and congested, but this disappears following recovery and requires no special treatment, but if residual sepsis is present in the tonsils, teeth, or sinuses this should be dealt with if possible before surgical treatment by thyroidectomy In the more severe cases it is advisable to postpone tonsillectomy till after the condition of the patient has been improved by thyroidectomy

If medical treatment is not effective in checking the activity of the disease and the patient continues to lose weight thyroidectomy may have to be carried out before a remission can be established Such a step is to be avoided if the activity of the disease can possibly be checked by any other method, for in such a case the operative risk is considerable, but it should not be delayed until the patient's condition becomes too serious If necessary, a preliminary ligation of thyroid arteries should be carried out, the subtotal thyroidectomy being subsequently performed in one or two stages, according to the patient's condition

Auricular Fibrillation

In the presence of auricular fibrillation and congestive heart failure prolonged medical treatment may be required before thyroidectomy can be safely performed, but once the fibrillation is established this is the only treatment that can restore health Digitalis should be used to control the ventricular rate, and care must be taken to avoid digitalis poisoning, for the ventricular rate is more difficult to control than in auricular fibrillation due to other conditions, especially when the disease is actively progressing Salyrgan and other diuretics are of great value when ascites and oedema are present Previous to thyroidectomy quinidine is not advisable, for even if normal rhythm can be established it is not stable Following subtotal thyroidectomy the rhythm frequently reverts to normal spontaneously, but if the irregularity persists at the end of one or two weeks quinidine should be given

Surgical treatment should be regarded as an incident in the management of the case, following it a long convalescence of three to six months is advisable, and the patient must be guided and guarded through infections and the worries and troubles of life Small doses of iodine (Lugol's solution, 5 or 10 minims daily) are advisable for three months following operation, and aid in the necessary readjustment of the endocrine system before health can be regained

Surgical Treatment

Surgical treatment should not be considered when the early manifestations of the disease appear When the disease becomes established through failure to respond adequately to the measures already indicated it becomes advisable to diminish the amount of secretion by resection of gland tissue The patient will naturally want to know the degree of improvement to be expected

This disease is not analogous to a condition such as appendicitis in which the affected organ can be completely removed The patient has still to rely on the gland tissue left after resection for the physiological needs of the body The surgeon must therefore know by experience how much should be resected to obtain the greatest improvement possible while still leaving sufficient behind If this is judged wisely the benefit is so great as to approach a cure The pulse rate falls, the mind and body become tranquil, the feeling of heat disappears, the appetite—which in many patients has been excessive—and the basal metabolic rate both approach normal The improvement in the eyes varies with the degree of exophthalmos, when this has been moderate it often disappears There is nearly always some improvement, but when exophthalmos has been very pronounced the improvement in the eye signs may occasionally be disappointing

When the disease has lasted a long time, or when complications have been severe, the improvement is no less striking and the relief is great, but if the heart has been gravely exhausted it cannot recover its original efficiency The patient may feel well, but strength should not be tested beyond the limits of safety, and these limits are soon learned by experience Auricular fibrillation disappears and normal rhythm is regained in about 80 per cent of cases Congestive heart failure due to thyroid toxaemia can be easily avoided after thyroidectomy Glycosuria often disappears, if not, it is sometimes controlled by dietetic measures If diabetes mellitus is a complication and has become difficult to control by insulin it is more easily controlled after thyroidectomy If mental disturbances have been a direct result of the disease great improvement follows operation, but if the mental condition has preceded the symptoms of thyroid disease, or if it is of the depressive type, great care should be taken and the help of a psychiatrist sought

In few diseases is the relief to the patient following operation so great as it is in toxic goitre This must not tempt the surgeon to perform thyroidectomy in unsuitable cases, and hesitancy must be exercised, especially when the thyroid disturbance is subordinate to other factors contributing to the ill-health of the patient

The death rate remains about 3 per cent when an average proportion of very severe cases have to be dealt with Injury to parathyroid glands is now rare, injury to a recurrent laryngeal nerve is not so rare, haemorrhage—primary or later—is avoided by the most careful haemostasis Thyroid operations should not be performed when it is difficult for the surgeon to reach the case quickly in case of necessity during the first twenty four hours after the operation

Anaesthesia

Good anaesthesia contributes greatly to the safety of all operative procedures on the thyroid gland Chloroform is unsafe, ether is to be deprecated Satisfactory anaesthesia is obtained by nitrous oxide and oxygen helped by a hypnotic dose of avertin, together with infiltration of the neck with local anaesthetic solution

mittee representative of the local profession treatment shall be given only as under

and then there followed clauses setting out the cases in which it was proposed that treatment should be given

Miscellaneous Matters

Correspondence with the London Public Medical Service with regard to its proposed extension was brought forward and it was pointed out that in view of the decision reached by Council those Divisions which had expressed themselves as not in favour of the proposed extension of the London Public Medical Service should now be informed of the necessity of passing a further resolution contracting out if they desired to be excluded from the area of the service The committee decided that the matter be left in the hands of the Metropolitan Counties Branch

It was agreed to bring to the notice of insurance companies the resolution of the last Annual Representative Meeting to the effect that where a medical certificate was required by an insurance company in the case of a deceased patient not previously examined for life assurance such certificate should not be furnished without the previous consent of the nearest relative and a fee of not less than half a guinea should be paid by the company

An account was given to the Medico Political Committee of the evidence recently given on behalf of the Association to the Select Committee on Medicine Stamp Duties Although the Association is not directly concerned with the revenue aspect it was considered desirable that a short statement of its general views on the indiscriminate advertisement and sale of patent medicines should be submitted to the Select Committee A short memorandum was supported in oral evidence by the chairmen of the Medico Political and Science Committees

The question of professional secrecy at sea which is a subject of peculiar difficulties was brought forward by a member of the Association and was referred for consideration to the Ship Surgeons Committee

The action of the office was confirmed in regard to various replies on questions submitted to the Association and to other matters

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Commander G Kirker to the *Pembroke* for Royal Naval Barracks

Surgeon Lieutenant Commander R L G Proctor to be Surgeon Commander

Surgeon Lieutenant S R G Pimm has retired from the Service at his own request

Surgeon Lieutenants C J Mullen to the *Drake* for Royal Naval Barracks P G Burgess to the *Abingdon* G A Lawson to the *Drake* for Royal Naval Hospital Plymouth M G Peever to the *Endeavour* on commissioning

ROYAL NAVAL VOLUNTEER RESERVE

Lieut Col J B Hamilton C I E has [illegible]

Lieut Col R S Spinall C I E [illegible] from leave has been posted a Civil Surgeon [illegible] from October 19 1936

Major R Sen to be Lieutenant Colonel

The appointment of Major Atab Singh Garewal in the Central Provinces Jail Department has been confirmed as from August 1 1935

The appointment of Major G Verghese in the Bihar Jail Department has been confirmed as from December 1 1935

The services of Captain J P J Little have been placed temporarily at the disposal of the Government of the Punjab as from August 10 1936

The services of Captain Hafiz Bikhsh have been placed temporarily at the disposal of the Government of the Punjab as from September 25 1936

The services of Captain R L Raymond have been placed temporarily at the disposal of the Government [illegible] November 5 1936

Capt in J P Dogra Officiating [illegible] to Haffkine Institute Bombay has been allowed [illegible] under the Indian Research Fund Association

Captain C J H Brett has been appointed temporarily as Assistant Port Health Officer Karachi on probation as from December 2 1936

The seniorities of Lieutenants A G Miller J F Thomson and J G Thom on have been antedated to September 1 1935 March 17 1936 and May 1 1935 respectively

Lieutenant E H Wallace has been restored to the establishment

Lieutenant E N Brockway has relinquished his probationary appointment

LONDON COUNTY HOSPITALS

FACILITIES FOR MEDICAL EDUCATION

Sixteen of the general hospitals maintained by the London County Council have now been affiliated with medical schools for the purpose of providing clinical instruction to undergraduates, and at seven of the general hospitals provision has been made for residential accommodation and instruction in obstetrics of students from an equal number of schools Sir Frederick Menzies, in a report on the hospitals and general medical services of the Council,[1] devotes his introduction to the development of facilities for medical education in the hospitals formerly administered by the Poor Law authorities Very limited facilities for students existed in the Poor Law infirmaries, as they were called, notwithstanding an immense amount of clinical material very suitable for the training of undergraduate and post-graduate students The realization of the importance to medical progress of providing every possible facility for medical education has been one of the features of the six years of the Council's administration

Recognition from Examining Bodies

In addition to the arrangements for undergraduates, special arrangements are made at certain of the general hospitals for classes of medical men and women preparing for the final Fellowship examination of the Royal College of Surgeons In view of the great opportunities in the general hospitals for obtaining the clinical experience necessary to the acquisition of the higher professional qualifications, it was considered desirable that the hospitals should receive recognition from the examining bodies as establishments where such experience could be obtained All the Council's general hospitals have now been recognized by the University of London for the degree of M D, Branch 1 (General Medicine), and ten hospitals with large maternity and gynaecological departments have received recognition by the British College of Obstetricians and Gynaecologists for the diploma and membership of the College Arrangements have also been continued for students from the London medical schools to attend the infectious diseases hospitals For this purpose students from each medical school are allocated to a particular fever hospital Courses of instruction in clinical practice and hospital administration for medical men and women who intend to sit for examinations for the D P H have been provided, and authority has been granted by the Council for examinations for certain degrees and diplomas to be held at any hospitals by arrangement with the Council's medical officer of health

During the year with which the report deals the new post-graduate medical school at Hammersmith Hospital was opened by King George V, who expressed the hope that the school would draw students from all parts of the Empire The students who joined during the first few months came from nineteen countries Apart from the British Isles, the greatest numbers were from India, Canada, South Africa, and Australia in that order To complete the account of facilities for medical education provided by the London County Council, it may be mentioned that at the children's and tuberculosis hospitals facilities are afforded from time to time to groups of students, usually under the sponsorship of recognized professional organizations, to visit the hospitals to receive information on the work and methods of treatment in progress, and post-graduates may also obtain experience of the technical and administrative methods adopted in the Council's pathological laboratories and its antitoxin establishment Reference is made in the report to the fact that permission is given from time to time for clinical and other meetings of Divisions of the British Medical Association and other medical societies to be held at the Council's hospitals, such meetings "enabling local general practitioners to keep in touch with the work of their district, and promoting cordial and friendly co operation between the practitioners and the hospital staff"

Control of Whooping cough

One important matter dealt with at length in the report is the control of whooping cough Whooping cough is a major cause of death in childhood, ranking fourth among the principal causes of death of children under 5 in London during a period of five years An average of about 2,300 cases are admitted to the Council's special hospitals every year The average case fatalities per cent in the Council's hospitals of the four common infectious diseases during the last five years have been whooping cough, 8 47, measles, 5 21, diphtheria, 4 11, scarlet fever, 0 48, but it should be added that the cases of whooping cough and measles admitted to hospital are selected, and those of diphtheria and scarlet fever are not

It is pointed out that while, *a priori*, isolation should be an effective procedure in the control of epidemics, in practice it is not so successful, owing to the fact, in whooping-cough, that the early catarrhal stage is the most infective, and that by the time the "whoop" appears infectivity is much diminished In consequence the practice of segregating only definite cases has little influence on the spread of the disease Hospitals, therefore, must be considered as concerned more with treatment than with prevention of spread In comparison with the average case of scarlet fever, whooping-cough has undoubtedly a greater claim to hospital accommodation Epidemics of whooping-cough tend to alternate with epidemics of measles, and it is improbable that the peak requirements for the two will coincide When measles is prevalent however, accommodation for whooping cough will be inadequate At such times the admission of uncomplicated cases of scarlet fever should be reduced to a minimum The length of stay of cases in hospital might also be diminished In three or four weeks a large proportion of cases are free from infection and from dangerous and serious complications

With regard to immunization against whooping cough the report states that the available evidence suggests that this either prevents or attenuates attacks, but is not yet conclusive enough to warrant the general application of the method "There is little doubt that in the near future the immunizing agent, dosage, and technique will, as in the case of many other infectious diseases, have the approval of all competent medical and scientific opinion Thereafter, since the method of immunization for all diseases is similar, all immunization should be performed by the same authority" In London campaigns for immunization (mainly against diphtheria) are conducted by the metropolitan boroughs It is considered that there is a case for the unification of immunization schemes in London

Other Medical Services

The greater part of the report is occupied by statistical tables affording much useful and curious information One feature is the continual rise in the number of births in Council hospitals and institutions These have increased by more than 50 per cent in five years, from 10,000 in 1931 to 15,500 in 1935 The number of patients seen at the ante-natal clinics has doubled in four years, from 48,000 in 1932 to 97,000 in 1935 Under the district medical service scheme part-time general practitioners during the year made 53,710 domiciliary visits and dealt with 173,218 attendances at the medical relief stations The corresponding figures for medical officers on the staffs of hospitals were 15,960 and 92,181 respectively The examinations carried out in the group and institutional pathological laboratories during the year numbered 441,267, an increase of over 60,000 on the year

Finally, there is the comprehensive organization for getting casualties to hospital The accident ambulances were called out 47,634 times in the year

Meetings of Branches and Divisions

ABERDEEN BRANCH ABERDEEN AND KINCARDINE COUNTIES DIVISION

At the invitation of the directors the Aberdeen and Kincardine Counties Division made an inspection of the new buildings of the Aberdeen Royal Infirmary on October 14 1936 when the medical superintendent Dr J C Knox conducted a party of about one hundred members and their wives round the various departments A most enjoyable and interesting afternoon ended with tea in the lounge of the nurses home On behalf of the Division Dr ROBERT BRUCE thanked Dr Knox and the directors for their kindness

On November 26 1936 the Division met at Stonehaven and Dr R T DUTHIE (Aberdeen) delivered a lecture on Cardiac Irregularities He showed two films illustrating his subject The lecture and films were very much appreciated and a keen discussion followed in which most of the members present took part After tea a Medical Services Subcommittee for the county of Kincardine was formed Drs J W C Fairweather H Grant MacPherson W H Milligan and G H Swapp were appointed members with power to co opt further members if necessary

DUNDEE BRANCH

A meeting of the Dundee Branch was held at University College Dundee on December 4 1936 when the president Professor D RUTHERFORD DOW was in the chair and ninety eight members and non members were present

Professor JOHN FRASER (Edinburgh) delivered a British Medical Association Lecture on Head Injuries in General Practice As an indication of the importance of the subject Professor Fraser pointed out that largely due to the greater use of the motor car head injuries were on the increase and that at the Edinburgh Royal Infirmary not a day passed without one or more cases of head injuries being admitted He approached the subject from the point of view of a practitioner situated away from hospital facilities and compelled to rely on his own resources He explained the need for careful examination of the scalp from the point of view of haemorrhage and sepsis Fractures of the vault were not in themselves more serious than other fractures except in so far as they caused compression haemorrhage etc Fractures of the base were serious not only on account of damage to brain tissue but because they opened up channels of infection The meninges might be damaged with risk of haemorrhage and this might occur on the side remote from injury The brain substance might be involved in various ways by concussion compression by bone blood or oedema or by laceration The lecturer traced carefully the steps that must be taken in assessing damage The degree of unconsciousness must be ascertained by asking name by pressure on supra orbital nerve or by *touching the cornea* Lumbar puncture was valuable in the early stage as giving evidence of blood or pressure but care should be taken to avoid loss of fluid at this stage Later a more complete examination should be carried out and the pressure should be examined with a manometer Sedatives were of value such as the bromide and chloral mixture if the patient could swallow or a suppository of aspirin and codeine The temperature must be recorded on a two hourly chart and the patient watched carefully throughout The fundus should be examined for signs of optic neuritis If in spite of treatment intra-cranial pressure continued to increase the practitioner must be prepared to perform subtemporal decompression preferably on the affected side

Professor Fraser illustrated his address by a number of lantern slides

A discussion followed in which the PRESIDENT Professor R C ALEXANDER Professor D F CAPPELL Dr J M STALKER and others took part At the conclusion Professor Fraser received a very hearty vote of thanks for his interesting address

EAST YORKSHIRE BRANCH

A clinical meeting of the East Yorkshire Branch was held at Hull on November 27 1936 when Dr S F FOURACRE was in the chair

Mr C H CORBETT demonstrated two cases of splenic anaemia treated by splenectomy The spleen in the first (the patient was a woman) weighed 28 oz and the red corpuscles had risen from 850 000 to 2 200 000 in a few weeks after operation In the second case (a male) there was a red cell count of 2 500 000 before operation and it was now 4 300,000 the spleen measured 15 inches by 8 inches Mr Corbett then demonstrated a case of tumour of the sacrum a section of the growth showed it to be a chordoma The tumour had displaced the rectum and bladder Mr Corbett also showed a case of carcinoma of tongue and a case of carcinoma of the mouth both responding well to treatment with radium Mr J HUGHES demonstrated a man suffering from multiple abdominal tumours which appeared to be mucinous cysts of the peritoneum Another case was that of a man who suffered a fracture of the head of the tibia involving the knee joint from which 1 pint of blood was aspirated The fracture had been treated by means of a portable metal extension apparatus devised by Mr Hughes and which permitted of movement of the joint from the beginning of the treatment

Dr D C MUIR showed a man who suffered from rheumatic endocarditis pericarditis and rheumatic pneumonia He had large rheumatic nodules on both elbows and on his occiput

Dr JEAN M BARROWMAN demonstrated a case of pernicious anaemia which had recently come into hospital with the latter being reduced by pancreatic abdominal [illegible] two cases were both members of the same family [illegible] aged 50 and a sister aged 45 Both were [illegible] Friedreich's ataxia

Dr W MORTON showed a man suffering from diabetes mellitus who had early developed hyperglycaemic and hyperglycaemic coma and who was now being controlled by three units of protamine zinc insulin (neo insulin retard) and fifteen units of insulin daily

Dr D I MCRAE TOD demonstrated a case of a woman aged 48 suffering from progressive myositis ossificans and a typical case of osteitis fibrosa cystica

After being entertained to light refreshments the members of the Branch were shown numerous lantern slides and films by Dr R HEPMON The cases shown included secondary deposits in bones from a carcinoma of the oesophagus from mammary carcinoma carcinoma of the prostate periosteal sarcoma and some of the cases from other members of the staff—the chondroma pyaemia myositis ossificans and osteitis fibrosa cystica

After a discussion on the cases Dr L L LYNN proposed and Dr J E BANNEN seconded a vote of thanks to Dr [illegible] had demonstrated the cases and to the [illegible] staff who had helped to make the meeting [illegible]

GLASGOW AND WEST OF SCOTLAND BRANCH CLUB DIVISION

At a meeting of the Glasgow Division held at Glasgow on December 1st 1936 with Dr JAMES COOK in the chair consideration was given to the Maternity Services (Scotland) Bill All practitioners in Glasgow had been invited to attend the meeting

After a few opening remarks by the chairman Dr J F LAMBIE gave a resume of the provisions of the Bill and indicated that in certain quarters a fee of £10 had been suggested as a suitable remuneration for practitioners under the Bill A full discussion followed Dr J INGLIS CAMERON emphasized the importance of looking at the problem as a whole Private practitioners would never gain an interest if they showed their willingness to co operate with the [illegible] health side of the profession It was most essential that the profession should work towards the day when the profession as a whole would be able to express its opinion to the politicians and to the central and local authorities whose duty it was to organize the medical services A series of questions were then asked and answered and a prolonged discussion turned round the question whether it was desirable to move any formal resolutions at the meeting Dr LAMBIE expressed his willingness and desire that the meeting should be regarded as purely educative in character in view of the fact that no concrete proposals had yet been put forward No formal resolution was adopted

HERTFORDSHIRE BRANCH BARNET DIVISION

A meeting of the Barnet Division was held at [illegible] on December 8 1936 when Dr N G THOMAS [illegible] chair

Sir STEWART DUKE ELDER gave an address on Focal Infection and Allergy with Special Reference to the Eye He said that it was on those difficult cases of inflammation of the eye which showed no obvious bacteriology or pathology that he wished to lay special emphasis The suggestion sponsored by Cohnheim and Rosenow that the conditions were due to a temporary bacteriaemia was discarded in favour of the allergic view The eye shared in the general systemic infection and in the event of a further systemic infection which was not pathogenic to the rest of the body the eye being sensitized

had been treated in the surgical out-patient department, and it is estimated that the expenditure involved in treating these cases was about £3,000, although the compensation recovered did not amount to half this sum The constructional work connected with the maternity pavilion and the new nurses' home was now well advanced, and it was hoped that these buildings would be occupied before the end of 1937 The total cost of this extension scheme would amount to approximately £500,000 The appeal issued in 1930 had produced nearly £300,000, but it would now be necessary to reopen the appeal for the further amount of £200,000 required, and for this purpose the managers had appointed an appeal organizer

Diphtheria in Edinburgh

The incidence of types of diphtheria among 625 cases and carriers from 1932 to 1936 has been investigated by Christison, Wright, Shearer, and Pearson They point out that the case mortality in hospitals of the Metropolitan Asylums Board in 1889 was 40 7 per cent, falling to 22 8 per cent in 1895 The corresponding figures for Edinburgh on these dates were 27 1 and 20 7 per cent With the introduction of antitoxin in 1894–5, the mortality fell rapidly, but within the past few years epidemics with a high death rate have been reported in various parts of England, and since in these epidemics there was often a lack of response to antitoxin, the homogeneity of the toxins produced by different strains of the diphtheria bacillus has been questioned The present workers found that 25 per cent of the strains of bacilli occurring in Edinburgh could not be included in the gravis, mitis, and intermediate types, and they adopted a classification into six types, although clinically the cases were classified as severe, moderately severe, or mild They found that Type II strain had been identified in 59 1 per cent of cases in 1933, but in only 26 9 per cent in 1936, while in contrast the number of cases showing Type IV strain had been practically non-existent in Edinburgh in 1932, but had rapidly increased in the later years Generally speaking, it was found in Edinburgh that the proportion of mild cases was decreasing and that of severe and toxic cases increasing Until the winter of 1935–6 Type II had undoubtedly predominated, while the disease had on the whole been mild It is pointed out that the proportional incidence of the various types differs geographically, for Glasgow had approximately the same incidence of Type II strains as Edinburgh in 1933, whereas in Leeds, Hull, and Berlin there was a high percentage of Type III strains The types also appeared to differ in each area from time to time—for example, in Manchester in 1935 the proportion of Type II strains decreased rapidly coincident with an increase in Type III strains The report points out that there is ample evidence that active immunization properly carried out and adequately controlled by Schick testing can go far towards reducing the morbidity from the disease, and cases of diphtheria among the nursing staffs of hospitals in Edinburgh and Birmingham had been practically eliminated since the introduction of routine immunization In Edinburgh the type commonly found in carriers among school children was Type VI in 60 per cent of cases The writers indicate that the biological relationship which appears to exist between the increasing Type IV in this country and the gravis type prevalent in recent epidemics both in England and Germany seems to show the likelihood of an increase in severity of diphtheria epidemics in the future and the importance of active immunization

---

A meeting of the London Jewish Hospital Medical Society will be held at the London Jewish Hospital, Stepney Green, E, on Thursday, January 14th, at 3 30 p m, when there will be a symposium on "Modern Aspects of the Prevention and Treatment of Infectious Fevers to be opened by Dr Andrew Topping Dr Maurice Mitman, and Dr J M McCartney, with the president, Mr Arnold Sorsby, in the chair

Reports of Societies

KALA-AZAR IN THE SUDAN

At a meeting of the Royal Society of Tropical Medicine and Hygiene at Manson House on December 10 a paper was read by SIR ROBERT ARCHIBALD on the epidemiology of kala-azar in the Sudan

Sir Robert said that the first case of kala azar in the Sudan was recorded by Sheffield Neave in 1902, since when definite endemic areas had been found mainly in the provinces adjacent to the Abyssinian frontier Sporadic cases had also been recorded in Southern and Western Sudan The disease had never appeared in epidemic form, the sporadic cases in the Sudan only serving to maintain a smouldering fire of infection with slight periodic increases in incidence in villages and towns in the endemic areas The endemic areas were confined to districts where the annual rainfall was ten inches or more, indicating that the disease bore some relationship to rainfall and humidity, it did not occur in the northern arid areas of the Sudan In the endemic areas a ten inch or more rainfall was usually obtained between the months of July and October, at this period humidity might reach as high as 90 per cent, day temperatures were low and the rainfall varied from 100 to 200 mm or more each month For the remainder of the year the climatic conditions in the endemic areas approached those of Northern Sudan From such data it appeared reasonable to infer that the seasonal incidence of the disease was between July and October, hospital records seemed to support such a hypothesis This short seasonal incidence might account for the absence of the disease in epidemic form in the Sudan No accurate data had been obtained to prove the incubation period of the disease, though experimental infection of monkeys suggested an incubation period of sixty to ninety days In the endemic areas adjoining Abyssinian territory cases of nasopharyngeal leishmaniasis (espundia) had occurred, but cutaneous leishmaniasis (*L tropica*), although looked for, had not been recorded

In the Sudan kala-azar had rarely occurred among Europeans There was no connexion between occupation and disease Data showed the importance of proximity or prolonged contact with cases to be in some way concerned with the problem of transmission In several cases there was a familial incidence of the disease Ambulant cases, not ill enough to seek treatment, were also detected Records showed that adult males and males under 15 were more liable to infection than females

In 1934 a total of 289 cases of kala-azar was recorded, in 1935 the incidence was reduced to 171, probably as the result of better medical supervision, the detection of early ambulant cases, and increased facilities for treatment The formol gel test for the detection of kala-azar had given disappointing results, but used in conjunction with the urea stibamine test it was of value Morphologically and culturally the causal parasite of kala azar in the Sudan was identical with that found in other countries Clinically the disease was similar The causal parasites were usually found with ease in spleen puncture and in smears In the Fung Province parasites were present in the nasal smears of five out of seventeen cases In thirty-five cases, in all stages of the disease, no parasites were seen in 320 peripheral blood films examined In the Kapoeta district in South-Eastern Sudan parasites were invariably present in the peripheral blood The viability of parasites in nasal mucus was proved by animal inoculation Parasites were not found in excised portions of skin taken from six cases

Man was apparently the only host of kala azar Domestic and other animals examined were never observed to be infected Canine kala-azar has not been found in the Sudan Blood-sucking insects, mosquitos, sandflies, Jassid bugs, bed-bugs, fleas, ticks, and lice collected in kala azar hospital wards and kala-azar huts were examined for

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses advanced urology at St Peter's Hospital January 18 to 30 general practitioners course in chest diseases at Brompton Hospital January 25 to 30 gynaecology at Chelsea Hospital for Women February 8 to 20 clinical and pathological M R C.P course at National Temperance Hospital Tuesdays and Thursdays at 8 p m February 9 to 25 children's diseases at Princess Elizabeth of York Hospital February 20 and 21 surgical tutorial classes especially intended for Final F R C S candidates at National Temperance Hospital Tuesdays and Thursdays at 8 30 p m January 12 to March 4 The first fortnight's programme is as follows January 12 Mr A J Cokkinis, Breast January 14 Mr A M A Moore Injuries to Bones January 19 Mr R Y Paton Deformities January 21 Mr C A Joll Thyroid Unless otherwise stated courses and lectures arranged by the Fellowship of Medicine (1 Wimpole Street W) are open only to members and associates

The Joint Tuberculosis Council has arranged a post graduate course on diseases of the chest with special reference to chronic pulmonary suppuration to be given by the medical and surgical staff of the City of London Hospital for Diseases of the Heart and Lungs Victoria Park E from February 1 to 6 The fee is £3 3s and all inquiries should be addressed to Dr William Brand honorary secretary for post graduate courses Joint Tuberculosis Council 8 Christ Church Place Epsom Surrey

A series of post graduate lecture-demonstrations will be given by members of the medical and surgical staff of the General Infirmary at Leeds on Tuesdays at 3.30 p m from January 12 to March 16 inclusive Details will be published in the post graduate diary column of the *Supplement* week by week

explained that, while it was now possible to determine accurately the number of "r" units which were being administered, it was impossible to forecast exactly what effect any particular dose would have on the skin of any individual He stated that the common procedure today was to give heavy doses of x rays, well filtered, over a period of three to five weeks, and made it clear that the tendency of patients to omit a day's treatment for various reasons negatived the possibility of accurate dosage He further urged that, wherever possible, patients should be told the truth regarding the malady from which they were suffering, as it was otherwise almost impossible to get them to submit to the suffering and discomfort associated with the heavy doses of x rays required to produce retrogression of a tumour growth

Dr ANGUS SCOTT described in detail a case of chronic adhesive pericarditis Operation failed to relieve the condition At necropsy evidence was found to show that the condition was of tuberculous origin

ANXIETY NEUROSIS

A meeting of the Devon and Exeter Medico-Chirurgical Society was held on December 17, 1936, the president, Dr A HIPWELL, being in the chair Dr H W EDDISON read a paper on "Anxiety"

He said that anxiety was the natural response to an external situation which threatened to become overwhelming, and was the subjective component of a general psychosomatic response which had not yet become differentiated into fight or flight It was thus to some extent analogous to bodily pain, which in its turn was part of a reaction against bodily disorders or threats from within Carrying this conception further, appropriate contrasts in their bodily components might be expected, thus with anxiety would be found general alertness and brisk superficial reflexes, while in bodily pain there might be concentration upon the lesion within and withdrawal from the outer environment It was probable that neither anxiety nor bodily pain was in proportion to the exciting cause Bodily pain might be forgotten in the urgency of an external situation and, conversely, external risk might seem remote in the case of an intolerable internal pain In both the matter was one of balance between the internal and external direction of the psychosomatic response Just as anxiety was a response to a real external menace so could normal everyday situations appear relatively overwhelming and give rise to anxiety when there was failure in the physical health In the old, anxiety and worry were so general and easily aroused as to be almost normal senile findings The elderly became less and less adaptable to the ordinary situations of everyday life, which appeared relatively formidable Treatment lay in preserving strength by reducing the activities, one day in bed each week or fortnight did much in allaying anxiety As opposed to cases with an obvious basis for anxiety the most troublesome were those with no tangible cause but only a dread of impending disaster ready for attachment to trivial incidents To explain this elusive type of free anxiety Dr Eddison referred to two methods of dealing with inconvenient instinctive tendencies—namely, replacement by opposites, and avoidance of the situation likely to evoke the impulse As an example of the first method he instanced the apparently tender-hearted onlooker exclaiming that he would like to horsewhip a fellow who was ill-treating an animal Here the aggressiveness of the onlooker had been evoked, quite unaware that he was making the occasion a secondary situation for his own aggressiveness In illustration of the second method there was the person who objected to watching performing animals because he or she could not endure seeing them ill-treated The fact of ill-treatment being readily assumed, anxiety afforded protection by keeping the person away from a situation which would evoke his or her own primary aggressiveness The external threat to which the anxiety was a response, lay in the danger of unmasking a tendency which the individual was contriving to conceal from himself All phobias had this structure, and mental pain protected a mental tender spot from excessive stimulation From this it would be seen that reassurance as to the present or secondary situation would prove neither helpful nor acceptable to the patient More could be done by a sympathetic understanding that the troubles seemed real to him, but at the same time questioning whether they were the real troubles The patient accepted the physician as an ally, and the unconscious primary situation lost some of its menace Although this involved dependence on the physician it was the next best procedure to a prolonged investigation of the root causes Another troublesome class comprised those who did not feel anxiety in situations justifying it, but who showed later the physical signs of anxiety for a long time In the war many, in spite of their anxiety, stuck to their posts and masked their anxiety behind their deeds working off their emotion coincidently, but afterwards displayed tremors, brisk reflexes, dilated pupils, sweating diarrhoea, and loss of weight Dyspnoea and palpitation occurred in response to any emotional stimulus or call to action The symptoms tended to be obstinate, and thyroid enlargement might be present The speaker stressed the importance of the sequence of events should the subjective emotion of anxiety not be worked off at the time In such cases the physical components would often persist indefinitely or until the cause was unmasked through prolonged and detailed anamnesis No doubt some civilian cases of hypothyroidism were of like explanation Neurasthenia was a vague term, including many of the conditions in which anxiety was associated with depression, apprehensiveness, sleeplessness, and a tendency to fatigue In such cases it was often doubtful whether to place the case under strict observation Anxiety might be the forerunner of melancholia, a condition potentially suicidal and requiring the strictest precautions at all periods of life

Suicidal Tendencies

A decision on the suicidal tendencies should be based on the replies to three questions (1) Had there been recent deterioration in the capacity for mental effort? A slow response was suggestive, neurasthenics were not retarded (2) How did the patient explain his inability to concentrate? Fatigue from worry and loss of sleep was not alarming in itself, but vague reference to "different feelings" in the head or body and hypochondriacal ideas should arouse suspicion Retardation and the appearances of hypochondriacal symptoms for the first time should give sufficient warning of the need for constant observation day and night, but would not be sufficient to warrant removal from home so long as adequate supervision could be ensured (3) This was concerned with the patient's progressive failure to meet the demands of everyday life and his mental attitude towards that failure In the progressive stage there would be an attempt to rationalize the failure and to refer it to himself or herself and not externally Past errors of judgement and all kinds of self-accusation were brought forward to account for the trouble these patients considered they had brought on themselves and on those near to them and all hope for the future was abandoned If this state of mind was accompanied with refusal or inability to discuss hopes and fears for the future the strictest supervision was indicated in a suitable nursing home or mental hospital It was, however, advisable to elicit this loss of hope on two separate occasions, however close together and thus to avoid the charge of magnifying a casual remark Dr Eddison emphasized the importance of remembering that melancholia seldom lasted less than six months, its sudden disappearance suggested that suicide had been decided upon as the only way out Decision as to the ultimate discharge must be based upon the return of the patient's hopes, doubts and fears and willingness to discuss the future The doubts and fears should then be discussed with the nearest relative

NECROPSY AFTER ROAD ACCIDENTS

The great increase of motor accidents has brought with it a need for accurate statistics of causation Professor E Martin and Drs Pechoux and Hamdy[1] point out that an indispensable component of these statistics is the results of necropsy on the victims Public attention, thanks largely to the attitude taken by many periodicals, has been mostly directed to the motorist and very little thought has been given to the possible contribution of the pedestrian or cyclist to the accident Widmark has given figures showing a large incidence of drunkenness in victims of motor accidents and the French authors point out a possible cause which seems hardly ever to be taken into account defects of sight hearing and attention Many victims they say suffer from some condition which contributes even more to their death than the impact of the collision By way of example they cite the case of an elderly woman who died three days after a motor accident She had a large long standing perforation of the left ear drum and the right auditory meatus was completely closed by an enormous plug of impacted wax she must have been almost completely deaf A man of 62 who was knocked down by a tram had an opacity of the left cornea and a right sided cataract both his ears were plugged with impacted wax Out of sixty two victims who came to examination two old men had very fragile arteries two had diseased lungs one was in such a bad state of general health that a very slight injury would have been fatal and another died of appendicitis which flared up because of the injury They recommend that the stomach contents and the blood in the heart cavities of persons who are brought in dead or die soon after admission should be examined for alcohol and suggest that this is a common finding In this country the question of whether or not to hold a necropsy on the victim of a road accident is left to the discretion of the coroner To make an invariable rule that a necropsy must be done in these cases would *throw a heavy burden upon public funds* Nevertheless there is a good deal to be said for it and perhaps still more for enacting in any new legislation dealing with coroners' courts a provision obliging the coroner at the instance of any person who might thereafter be held liable for the accident to direct that a post-mortem examination be held and placing the pathologist's report at the disposal of the court and either party

BCG VACCINATION OF INFANTS

Although BCG vaccination of children was introduced in 1924 it is only within the past few years that carefully controlled experiments have been made to ascertain its real value One of the most important of these is that carried out during the past eight years in New York by Kereszturi and Park The experience of these workers on a total of 690 vaccinated infants and children all of whom were born into tuberculous families indicates that the vaccine is harmless for human beings though when administered parenterally it not infrequently gives rise to a cold abscess that may persist for several months These 690 children were divided into two groups One group comprising 269 infants were vaccinated by the oral route during the first ten days of life The other group comprising 421 infants and children most of whom were less than 1 year of age were vaccinated either intracutaneously or subcutaneously all of these were shown to be tuberculin negative when they first came under observation Control cases 345 and 410 in number were selected to correspond as closely as possible with the subjects in the two vaccinated groups The children have been followed up with great diligence and the results are now presented The tuberculosis death rate in the orally vaccinated group was 1 1 per cent in the control group 2 6 per cent in the parenterally vaccinated group it was 0 7 per cent and in the control group 2 7 per cent Combining these two groups the tuberculosis death rate was 0 9 per cent in the vaccinated as compared with 2 7 per cent in the control group Analysis of these figures showed that the observed difference of 1 8 per cent was 3 9 times the probable error—a difference that might be expected to occur by chance alone less than one in a hundred times Although the control subjects were on the whole exposed rather more frequently than the vaccinated to contact with open tuberculosis reasons are advanced to show that this was not likely to account for the difference in behaviour of the two groups Discussing these results the authors point out that the tuberculosis death rate in children of tuberculous families in New York City is 2 7 per cent during the first year of life while in the general population it is only 0 06 per cent In the children of open tuberculous families it is 7 2 per cent—that is 120 times as high as in the general population In their opinion this mortality is serious enough to justify the routine vaccination—preferably by the parenteral method—of all children born into tuberculous families The data now provided suggest that by this means the tuberculosis death rate could be reduced to one quarter of its present figure By combining BCG vaccination with removal of the infants from their parents until allergy had become established it might be possible to effect an even greater reduction

THE HALF-YEARLY INDEXES

The usual half yearly indexes to the *Journal* and to the *Supplement* and *Epitome* have been prepared and will be ready shortly they will however not be issued with all copies of the *Journal* but only to those readers who ask for them Any member or subscriber who desires to have one or all of the indexes can obtain what he wants post free by sending a post card notifying his desire to the Financial Secretary and Business Manager British Medical Association House Tavistock Square W C 1

We regret to announce the death in London of Dr David Fraser Harris formerly professor of physiology in Dalhousie University Nova Scotia

lococci and *M catarrhalis* The blood pressure was 105/65 mm Hg, and nothing abnormal was found in the urine At the start of the illness there was a slight constipation

The patient was kept in bed from the start and given 5 grains of aspirin twice daily Four pints of liquid in the form of tea, orangeade, or lemonade with much sugar was given each day, together with a diet poor in protein and rich in carbohydrate From the eighth day, when the first signs of resolution were observed, ammonium chloride was given as an expectorant, together with caffeine, to stimulate the circulation

If I compare this history of influenza with the experiences of the epidemic of 1918–21 there are some differences and some points of similarity One of the clinical differences is the appearance in this case of a tonsillitis at the beginning and end of the illness In the epidemic of 1918 I invariably observed the appearance of *H influenzae* in the sputum and also cultured it from the blood, lungs, glands, and other remote organs in those cases where a post-mortem examination was made

As in this case we observed the sudden onset with bronchopneumonic symptoms, which in severe cases rapidly led to death from heart failure In other cases death occurred after the second week Post-mortem examination of these cases showed that there were widespread foci of congestion, which in many cases almost amounted to abscess formation, in much larger areas of the lungs than could be discovered by clinical examination There were also distinct areas of empyema, which not only were situated on the base of the lung but were also frequently interlobar Any active interference by puncture or other method was extremely dangerous, and was therefore avoided, as it usually proved fatal Streptococci and pneumococci were found in the later stages, together with *H influenzae*

Large doses of camphor oil given by intramuscular injection as "depot doses" or treatment with cardiazol, digitalis, or caffeine from the beginning proved to be useful in combating the heart failure Toxic symptoms such as nasal and skin bleeding were frequently observed The intake of large amounts of liquid with much sugar may have had the effect of diluting the toxins and of replenishing the loss of water in the circulation The sugar has perhaps a useful influence on both liver and heart muscle Quinine and salicylates were used at the beginning, but had no more effect than any other type of specific or unspecific treatment—I am, etc,

London, W 1, Jan 4 ERNST FRAENKEL

Blood Transfusion Fatalities

SIR—In the correspondence in the *Journal* following my report of six fatalities from blood transfusion (*Journal*, 1936, **2**, 1186) there are requests for further information, and many points, some directly arising from my paper, are raised

These cases were collected at Guy's Hospital while I was a medical registrar there The preliminary tests and the operations were performed by house officers with the following experience in two cases, at least fifty previous transfusions in one case, two previous transfusions, in three cases between ten and thirty transfusions With regard to technique, in all these cases the blood was taken into citrate (two to three ounces of 3 8 per cent sodium citrate) in an open glass beaker immersed in hot water and transferred immediately to the recipient by tube and funnel Unfortunately the case records do not give any indication of the rate at which the transfusions were actually given in these six cases The custom at the hospital at this time was to take between twenty and forty minutes to run in a pint of blood

Mr Wilfrid Adams refers to the risk attached to transfusions in cases of peptic ulcer or neoplasm of the alimentary tract If any conclusion can be drawn from five such fatalities (the sixth case was clearly the result of mistaken grouping), it is to be noted that in each case the haemoglobin percentage was under 40 and the anaemia was of some duration In so far as patients with peptic ulcer or malignant disease of the alimentary tract may have secondary anaemias of this severity and chronicity, I should regard them as bad risks for blood transfusion in the light of these experiences The risk is not nearly so great in cases with recent haemorrhage and anaemia, probably because the question of cardiac efficiency is of less importance in these cases Six fatalities in two and a half years are rather alarming, but it should be mentioned that at this time (1930-32) about 500 to 600 transfusions were being given each year at Guy's Hospital, making a total of 1,500 to 1,800 in the three years covered These figures are only a very rough estimate based on incomplete returns, so that they cannot be used for giving a percentage mortality In the last three years the number of transfusions per year has fallen

Referring to Case IV, with mitral stenosis and haemolytic anaemia, I entirely agree with Dr Vaughan Facey that a very much smaller quantity of blood should have been given, and preferably none at all I do not wholly agree with another statement of his that 'reports of cases that have been transfused by inexpert operators can do nothing but confuse the issues" Throughout the country many transfusions are being performed by less experienced men and under less suitable conditions—of the results we never hear—and unless fatalities are put on record blood transfusion will continue to be used as "a harmless tonic," which it certainly is not

As Dr Vaughan Facey says, it is within the experience of most of us that patients have received repeated transfusions from the same donor without ill effect, but that severe reactions do occur is shown by Case V (I was not able to find any other record of such a fatality) and the references I gave in my paper As it is presumably a question of anaphylaxis one would not expect shock to occur in every case, or possibly in more than a few cases The time element may be important In the published cases the intervals between transfusions varied from fourteen days to eighteen months I would, however, make a very strong plea for cross agglutination tests before each transfusion from the same donor—a practice which is not at all general

Several correspondents stress the importance of running the blood in very slowly, especially in cases of heart disease and chronic anaemia, and with this I am in entire agreement The time taken must, however, be within the limits of the technique employed With longer than forty five minutes by the tube-and-funnel method the risk is run of too great a fall of temperature of the blood after it has traversed the length of rubber tubing, of coagulation, and possibly of other changes in the blood From this point of view it would be interesting to learn the results of the slow-drip method mentioned by Dr F Graham Lescher, and of continuous drip transfusion (after Marriott) in a large series of cases The mortality of blood transfusion is so low (1 to 2 per 1,000 in published figures) that the results in a few hundred cases are of little statistical value

In both Cases II and III the reaction started two hours after completion of the transfusion It is difficult to believe that if the blood had been run in at half or twice the speed it would in any way have altered the severity or incidence of this delayed reaction The ill effects of giving blood too rapidly can be due either to the sudden increase of blood volume causing embarrassment of the right side of the heart or to high concentration of such factors as produce reactions The mechanical effect of increase of blood volume would give symptoms during the course of the transfusion Is it possible that the concentration of "anaphylactic" factors occurring in a very rapid transfusion would give such a delayed reaction two or more hours after cessation of the blood flow? Again, it is more probable that symptoms would develop during or immediately after the procedure It seems

severe cases is present even at rest, but in milder cases is noticed on slight exertion or emotional disturbances Sensations of heat that may be accompanied by a visible flush are complained of by the younger patients especially, and though most marked in the face, neck and upper thorax may be accompanied by an uncomfortable feeling of heat throughout the body The cardiac impulse is forcible and suggests a vigorous and rapid action of the heart It may be palpable all over the praecordium The apical impulse is diffuse, and can be felt outside the normal position even in the absence of cardiac enlargement In severe or long standing cases slight cardiac enlargement occurs, but if marked is indicative of some complicating factor such as hypertension or a valvular lesion The heart sounds are loud and sharp and systolic murmurs at the apex and base are usual The rate of the heart is rapid and varies with the severity of the disease rising to 180 per minute or over, but more commonly rates of 100 to 120 per minute are found

The heart's action is usually regular but if the disease is very severe in younger patients, or even if only mild in the older, auricular fibrillation is likely to arise With the onset of auricular fibrillation congestive heart failure results and life is endangered Previous to the onset of established fibrillation, paroxysms of auricular fibrillation or of auricular flutter, and extrasystoles, may occur The systolic blood pressure is usually raised and the diastolic normal, so that the pulse pressure is increased

Loss of Weight and Other Signs

The body weight and the rate of change in weight are valuable guides to the severity of the disease and to its activity So long as loss of weight continues the disease is active, cessation of loss and commencement of gain are indications of a remission In severe cases the loss of weight is rapid and striking several stones being lost in a few months In milder cases there may be no loss of weight at any time but those patients who show some of the signs of the disease but are persistently overweight must be carefully considered for in them the thyroid disturbance is not, as a rule the only cause of their ill health

Exophthalmos may be absent in the younger as well as in the older patients, but in the latter is more often slight in degree It is usually bilateral, but is frequently more marked on one side It may be so extreme as to dislocate the eyeball It may vary in degree from day to day, but when established is the most persistent sign of the disease, often remaining when recovery is otherwise complete Even when no proptosis can be demonstrated the eyes appear to stare abnormally This is due to retraction of the upper lid, which is the most common of the eye signs Excessive lachrymation contributes to the shining appearance of the eyes, other eye signs that may be present are infrequency of blinking lack of wrinkling of the forehead on looking upward lagging of the upper eyelids when the eyes are turned downwards, and difficulty of convergence on looking at a near object

Glycosuria is common at some time in the course of the disease, but there is no elevation in the value of the fasting blood sugar, it is not indicative of diabetes mellitus disappearing with recovery from the thyroid disease Diabetes mellitus may be present in addition to hyperthyroidism but not more frequently than in any other group of patients

Medical Treatment

The disease may subside and recovery be complete on medical treatment alone Even if surgical treatment is required the safest time in which to operate is when the activity of the disease has subsided and a remission is established The object of medical treatment is therefore to bring about a remission, and such treatment should be carried out even if the need for surgical treatment in addition is clear

Rest—Rest is the most efficient method of treatment, and it must be physiological as well as physical rest and rest for the mind as well as for the body This should as a rule be carried out in a hospital or nursing home not only because of possible exciting causes due to incompatabilities and worries in relation to the home or relatives but also because the mental unrest and irritability that result from the disease have usually been productive of friction and irritations even if these were absent before the onset Complete rest in bed is desirable at first in all cases It may have to be continued for weeks or months in the severe cases and in those with congestive heart failure but in the milder cases should be relaxed after a few days or weeks since its continuance unduly may be productive of unrest, both physical and mental The surroundings must be cheerful and the nurses and attendants agreeable

Diet—In view of the increased metabolism the diet should be a generous one well balanced and containing ample fresh food and vitamins The appetite is usually good, and no difficulty is experienced in getting the patient to take sufficient nourishment, but in a few instances it is poor and such patients require much skill and experience on the part of the nurses to get them to take enough food to enable the loss of weight to be checked Sleep is usually good but for the mental restlessness in the day time it is advisable to give a sedative and luminal in doses of half a grain (32 mg.) or 1 grain (64 mg.) two or three times a day is satisfactory It hypnotics are necessary, chloral or paraldehyde is suitable

Infections especially of the teeth tonsils and sinuses should be sought for and the patient's business and domestic affairs explored for sources of worry

Iodine—Considerable improvement usually results from the rest and other measures The tachycardia subsides the nervousness and restlessness diminish, and an estimate of the severity of the condition is obtained In some cases such measures alone suffice after one or two weeks to check the activity of the disease and a remission sets in with steady improvement and gain in weight In many, however the improvement is slight and temporary and iodine should then be prescribed This will produce a further improvement and should be given in doses of 10 minims of Lugol's solution or of liquor iodi simplex (*B.P.*) three times a day or in the form of potassium iodide 1½ grains (0·1 gramme) three times a day The full effect will be seen at the end of about ten days and the dose can then be reduced for prolonged administration small doses (5 to 6 minims daily) should be given In most cases either rest alone or rest and iodine will cause a remission and steady improvement will continue This may go on to recovery or more usually a stage of partial recovery only is reached and a mild but chronic condition sets in

Indications for Surgical Treatment

If after six months of efficient treatment it appears unlikely that complete recovery will ensue some method of reducing the amount of functioning thyroid tissue should be employed—either thyroidectomy or irradiation Irradiation takes several months to produce its effects and is therefore unsuitable for the more severe cases or

suspended vaccines locally injected in the more severe

In the same issue of the *Journal* Dr T Stacey Wilson, in his admirable "Manipulative Treatment of Fibrositis," showed that he had reached conclusions as to the pathology of fibrositis which were identical with my own, though attained by quite a different approach

Those who give whole-hearted loyalty to the focal theory will no doubt find such an extension of it as irritating as Dr Gordon's "metabolites"! But until Dr Gordon can give more definite evidence regarding the chemical nature of such "metabolites" I shall still feel that my own is the safer heresy—I am, etc,

G LAUGHTON SCOTT

London, W 1, Jan 1

Nervous Complications of Treatment by Gold Salts

SIR—Dr Graham Lescher's article on nervous complications following treatment by gold salts in the *Journal* of December 26, 1936 (p 1303) is of great interest in view of the increasing use of gold in the treatment of rheumatoid arthritis Perhaps an experience of mine with myocrisin would be of interest in the light of this article

A female patient with a history of rheumatoid arthritis of many years' duration was treated with myocrisin (oily suspension) intramuscularly in doses of 0 01, 0 01, 0 05, 0 1, 0 2, and 0 3 gramme at weekly intervals Following each injection she was given a drachm of calcium gluconate The first course was started in January, 1936, and no reaction, complication, or untoward symptom was experienced After an interval of four to five months a second course of injections of myocrisin of the same strength as before, but with a longer interval between the injections, was given A short time after the last injection of 0 3 gramme the patient experienced (*a*) great mental agitation, depression, apprehension, and fear of some unknown calamity, (*b*) insomnia, (*c*) excessive flushings and sweating, (*d*) fatigue, (*e*) twitching of muscles of trunk and limbs, called rigors by patient, (*f*) a choking feeling in the throat, with a stridulous inspiratory sound similar to laryngismus stridulus in children This cleared up after one dose of veronigen

I did not associate these symptoms with a gold reaction at the time, and would welcome Dr Graham Lescher's observation on the case Incidentally the rheumatism was much improved by the treatment—I am, etc,

H HUGHES JONES

Nevin N Wales, Dec 30, 1936

Scurvy

SIR,—In the jubilee number of *Guy's Hospital Gazette*, in Dr J M H Campbell's "History of the Physical Society," Sir William Hale-White is quoted as saying many years ago with reference to papers read in the early days of the society, "Scurvy was often mentioned, for it was then a terrible scourge, but probably now not a single one of you has ever seen a case in England" In view of the great rarity of this disease the following case is, I think, worth recording

An insured man, aged 48, came to my surgery on April 25 1928 suffering from extensive purpura in both legs, which were oedematous, with severe haemorrhages into both knee-joints The gums were spongy and the mouth foul He was anaemic and looked very ill, and was only just able to drag himself the fifty yards from his home to my surgery He refused to go into hospital I found that his wife had died six months previously, so that he had been neglecting his food and had had no green vegetables or fresh fruits, he was however well nourished I explained his trouble to him ordering him plenty of vegetables and orange juice, with Fowler's arsenic and iron mixture

On May 11 I wrote "He has now had no fresh haemorrhages for some days, but is still very weak" May 25 "Improving, no fresh haemorrhages and old ones fading" June 15 "Looks a different man, healthy rosy colour, still slight oedema of ankles" June 29 'Signed off'

I saw a number of cases in the Balkans during the war, but all were trifling compared to this case, which when first seen was rapidly heading for a fatal termination In private practice one comes across many patients who are "afraid to take vegetables or fruit" for fear of colitis or other digestive troubles, yet they somehow get sufficient anti-scorbutic vitamin to keep them entirely free from symptoms of scurvy, and it is rather astonishing that this man succeeded in cutting off his vitamin supply so successfully as he obviously did It is interesting to note the rapidity with which his very serious condition improved—I am, etc,

A A GREENWOOD, M B, B S

Godmanchester, Dec 28 1936

Cold Treatment for Gonorrhoea

SIR,—British practitioners may be interested to hear the suggestion of a Cairo colleague, Dr Moussalli The local heat treatment of gonorrhoea has given disappointing results, Dr Moussalli suggests cold The gonococcus can be killed by cold even more effectively than by heat and local irrigation of the urethra with a solution at 10° C will produce, without damage to the tissues, a temperature of 15° C, fatal to the gonococcus The heat treatment with a solution at 46° C only produces a local temperature of 41° C, which does not kill the gonococcus As I have no opportunity to test his assertion (that blenorrhagia can be cured in two days) I am writing to you in case your readers may be interested to try out this method

Dr Moussalli has also devised a very useful instrument for the coagulation by diathermy of the mucous membrane of the uterine cervix This he demonstrated at the Congress of Surgeons of Paris in October, 1936 It is a two-point (platinum points 3 mm apart) electrode, using a diathermy current at 300 to 500 milliamperes, capable of being rotated under control with a corkscrew like guide, so that in five or six minutes, with no anaesthetic and by applications of two or three seconds four times for each complete rotation, the whole cervix can be disinfected and in six to eight weeks cured—I am, etc,

Consistency of University Examinations

SIR—Professor Major Greenwood (*Journal* December 19, 1936, p 1285) has slightly misunderstood the main purport of my paper The results of my analysis do not of course, in any way invalidate those of Hartog and Rhodes On the other hand they do, I think, provide some reassurance that examinations in university subjects conducted by examiners who are actively engaged in teaching these subjects and who not only mark but also set the papers, are probably not so wildly unreliable as many people seem to think In *Examination of Examinations* results are published relating to particular tests which have been widely and uncritically applied to other examinations of very different type and run on very different lines

I fully agree with Professor Greenwood that, as published, my paper does not give adequate data for statistical purposes Since ninety-seven correlations are concerned

Nova et Vetera

SIR JAMES YOUNG SIMPSON

Dr Douglas Miller's presidential address before the Edinburgh Obstetrical Society at the close of last year was entitled "Thoughts on the Life and Work of Sir James Young Simpson." After a brief description of Simpson's youth and undergraduate career Dr Miller referred to Simpson's early post-graduate training, and in particular to his work as assistant in the department of pathology under Professor Thomson in whose association he found one of the great formative influences of his life. It was here that he formed the Hunterian don't think but try attitude of mind it was here that he developed habits of accurate observation and lucid description and it was Thomson who urged him to turn his attention to obstetrics.

At the age of 28 Simpson was appointed to the chair of midwifery at Edinburgh, and proved to be one of the greatest teachers in the history of obstetrics. He possessed in full measure the qualifications which Osler said the *good teacher must possess—the ability* to bring an atmosphere of enthusiasm unto the classroom a full and personal knowledge of his subject and a sense of obligation which compelled him to be also a contributor. Within a few years the class of midwifery became for the first time in its history the largest in the university, attended daily not only by students but by graduates from all over the world.

CHLOROFORM ANAESTHESIA

The discovery of the anaesthetic property of chloroform was of course Simpson's chief claim to the grateful remembrance of posterity. As a student his sensitive nature had been so revolted by the barbarous cruelty of an operation performed of course on a fully conscious patient that he had seriously contemplated giving up medicine in favour of law as a career. On that day had been formed the resolve to discover a means whereby the suffering which surgery then entailed could be avoided and all his thought and energy were consecrated to this end. From the earliest dawnings of history painless surgery was an ideal that had occupied men's minds and from time to time patients had been made insensible by drugs and vapours of various kinds. No anaesthetic agency, however had been found of sufficient merit to compel general acceptance until on October 16th 1846, Morton of Boston demonstrated the anaesthetic properties of ether in such a way as to convince the medical world. Three months later the first case of midwifery in which a general anaesthetic had ever been employed was delivered in Edinburgh under Simpson's care. This was an epoch-making advance but Simpson was not satisfied that ether was the ideal anaesthetic for his purpose. He wanted, if possible, to find a substance more rapidly analgesic, more portable and less unpleasant to inhale and after further research in which self-experimentation played an important part chloroform was discovered on November 4th, 1847.

SIMPSON'S OTHER ACHIEVEMENTS

Dr Miller then referred in some detail to the more important contributions which Simpson had made to the knowledge both of obstetrics and of general medicine and in particular to his work on delayed labour on puerperal sepsis and on hospital construction. A comparative study of the practice of obstetrics in 1840 when he was appointed to the chair with that of 1870 the year of his death left one with the conviction that with the notable exception of Listerism the advances made during Simpson's professional lifetime were as great in extent and importance as those which had been made since his death *and further that much of this improvement in* the standard of practice was due to his own observations and teaching.

If an attempt were made to analyse those factors other than home influences, which specially *contributed to his* greatness one found that there were three which might be briefly considered. First, an intellect of quite exceptional calibre. His studies on anaesthesia on delayed labour, on hospital construction all gave abundant evidence of originality and of profound thought directed along essentially practical lines. He was at once a master of obstetrical strategy and a brilliant exponent of tactics and technique. The second factor in Simpson's success was that complex quality termed personality of which in this case the chief components were an intense vitality and an ardent enthusiasm. The third factor and perhaps the most important, was his capacity for intense concentration and unremitting hard work. His work had the dual qualities of thoroughness and zest so that whatsoever his hand found to do he did it with all his might. His interest in his vocation amounted to an all absorbing passion so that it seemed to come naturally to him to scorn delights and live laborious days. No one did more than he to establish obstetrics as a science as well as an art but the debt we owed him was to be *measured not only by his contributions to our knowledge* but also and even more by the example he gave of an enthusiasm that never languished and a lifelong devotion to the highest ideals of our profession.

ANNALS OF MEDICAL HISTORY

The last instalment for the year 1936 of the *Annals of Medical History*[1] contains ten main articles in addition to book reviews and the two recent sections of Items of Interest and The Library the latter containing a new letter in John Hunter's quaint spelling from the fine autograph collection of Captain F. L. Pleadwell U.S.N. On the cover there is the portrait of Benjamin Smith Barton of Philadelphia the Father of American materia medica, about whom Dr. W. S. Middleton contributes what he modestly terms a biographic miniature. Professor first of botany and later of materia medica Barton was a naturalist, his name being preserved in the plants *Bartonia polypetala* and *Bartonia superba* and an archaeologist who argued that the North American Indians originally came from Asia. Miss Elizabeth Bixler writes on Joan Baptiste Pussin a forerunner of psychiatric nursing in the qualities of kindness sympathy and good humour at the Bicetre in Paris, where he worked under Pinel whose portrait forms the frontispiece of this number. The subject of psychiatry in art is explored with the aid of thirteen illustrations by Dr. C. E. Trapp and Mary C. Trapp and Dr. H. Silvette in an article entitled "The Doctor on the Stage" discusses medicine and medical men in English drama during the seventeenth century. The history of treatment by digitalis receives due attention from Dr. M. S. Jacobs who recalls the reason why Fuchs in the sixteenth century gave it the name digitalis because *its flower resembles the thimble* used for sewing. In his interesting account of mastoid ectomy Dr. Sonnenschein points out *that it was first performed* in England in 1868 by James Hinton the music author of the *Mystery of Pain* and aural surgeon to Guy's Hospital. In this article a well deserved tribute is paid to Sir Charles Ballance the grand old man of general and aural surgery. The history of foreign bodies in the air passages is set forth by Dr. L. H. Clerf the pulmonary pathology in the Talmud is analysed by Drs. H. H. and T. N. Harris and Dr. L. Goldman's article War and Science deals mainly with Virchow's activities.

Volume of six numbers £2 10 single numbers 10s. 6d.) New York: Paul P. Hoeber Inc. Medical Book Department of Harper and Brothers. London: Bailliere Tindall and Cox.

Medico-Legal

ARTIFICIAL INSEMINATION

SOME LEGAL ASPECTS IN THE U S A

The practice of artificial insemination in order that the wife of a sterile husband may bear a child is rare in this country, but has attracted some attention in America Dr Frances Seymour and Dr Alfred Koerner in an article in the *Journal of the American Medical Association* of November 7, 1936 (p 1531) point out a number of legal complications which they think may occur if the method comes into widespread use Naturally there has been no judicial decision on the matter, and conclusions can only be drawn by inference from established principles of law

The authors do not consider that artificial insemination can be adulterous, for by the law of New York State adultery is a physical relationship Nevertheless they insist that the husband should give a written consent in a prescribed form and that the wife should sign on the same form a declaration that she joins her husband in the request for the operation They also insist that both husband and wife shall make a finger-print opposite their signatures

REASONS FOR PRECAUTIONS

These precautions are taken to safeguard the medical practitioners from a subsequent assertion by the wife that she did not know what was going to be done, and in order that the man whom the woman presents as her husband shall be identified They insist on examining the man to make sure he is sterile, this makes it more likely that he is the husband and not some third party whom the woman has introduced in order to procure insemination under false pretences Both husband and wife are required to swear to their written consents before a notary Two copies are prepared, and these are deposited with two separate banks, and forgotten unless a legal complication should arise Under the law of New York State these consents legitimize the child and establish it as the legal heir of the family unit The authors fear that if these papers were not in existence the husband, tiring of his wife after some ten years, might be able to obtain a divorce by showing that he had always been sterile and denying the wife's story that he had assented to her artificial insemination In this country it is doubtful whether a court would grant him a decree He would first have to explain why he had delayed so long in bringing the proceedings He could bring medical evidence that he was sterile, but he would not be allowed to say in evidence that he had not impregnated his wife, for that would be bastardizing an apparent child of the marriage by giving evidence of non-access The wife might also plead that even if she had borne the child by another man, the husband had condoned the hypothetical offence by subsequent intercourse with her Even without such papers, the child of an artificial insemination would in this country be by law a child of the marriage

CONSIDERATIONS IN ENGLISH LAW

The question of inheritance is more important in the United States than in this country, where there is now no heir at-law The child of an artificial insemination could not be disinherited without an action of a quite unprecedented kind, based on lack of knowledge and consent by the husband The American authors consider that the wife of the donor must give written consent to protect her husband from a charge of adultery brought by her It is difficult to see why artificial insemination should be adultery by the donor if it cannot be adultery by the recipient, and in this country it seems hardly possible that a court could rule that it constitutes adultery by either party, for adultery does not consist in the begetting of a child, but in irregular sexual intercourse The chief consideration in English law must probably be the consent of the husband and wife, given with full understanding of the implications of the procedure There will be more likelihood of an action for malpraxis or conspiracy than of a petition for divorce

Universities and Colleges

UNIVERSITY OF LONDON

A course of lectures and clinical instruction for medical practitioners on mental deficiency and allied conditions has been arranged by the University Extension and Tutorial Classes Council in co operation with the Central Association for Mental Welfare, from April 12 to 24 The course will be based on the requirements for the University of London diploma in psychological medicine, and is intended for qualified medical practitioners, more especially for those who are engaged as school medical officers, certifying officers to local authorities under the Mental Deficiency Acts or as medical officers of institutions, or who are otherwise definitely concerned with the care of subnormal or abnormal persons This course constitutes Part I, and has been extended to a fortnight in order that considerable time may be given to practice in mental testing under the supervision of a psychologist Part II, devoted to the problems connected with the retarded and difficult child, formerly held immediately after Part I, will this year be held in the autumn Particulars will be sent out in July The University will grant certificates of attendance to those who have attended regularly, taking both theoretical and practical work All communications should be addressed to Miss Evelyn Fox, c/o University Extension Department, University of London, W C 1

ROYAL COLLEGE OF SURGEONS OF ENGLAND

The course of lectures for 1937 is arranged as follows January 15, Mr Laurence O'Shaughnessy (opened by Viscount Dawson of Penn), The treatment of cardiac ischaemia, January 18, Professor Evelyn Sprawson, Odontomes, January 20, Professor Russell J Reynolds, Movements of the oesophagus, stomach, duodenum, and ileum during the passage of an opaque meal, January 22, Professor A S Kerr, The higher autonomic control of the hollow viscera, January 25 Professor S Zuckerman, Tissue specificity in relation to sex hormones, January 27, Professor S Zuckerman, The interrelation of endocrine and neuro-vascular factors in the menstrual cycle, January 29, Professor Cecil P G Wakeley, The surgery of the parapituitary region, February 1, Professor Philip Wiles, Postural deformities of the spine, February 3, Professor Philippa Martin, The effect on the eye of radium used for treatment of malignant disease in the neighbourhood, February 5, Professor J H Saint, The bipp method of treatment of acute osteitis, February 8, Professor A R D Pattison Cushing's syndrome, February 10 Professor D W C Northfield, Some observations on headache, February 12, Professor F H Bentley Experimental nerve anastomosis, February 15, Professor G E Gask, John Hunter in the campaign in Portugal, 1762-3 (an account derived from the Loudoun letters recently acquired by the College), February 22, Mr David Slome, The nervous factor in traumatic shock All the lectures begin at 5 p m with the exception of Professor Gask's on February 15, which commences at 4 p m

The Services

HONORARY PHYSICIAN TO THE KING

Surgeon Captain L S Ashcroft, V D, R N V R, has been appointed Honorary Physician to the King, as from January 1 in succession to Surgeon Captain J B Ronaldson, V D, who has vacated the appointment

COLONEL COMMANDANT, R A M C

Major-General W H S Nickerson, V C, C B, C M G has been appointed Colonel Commandant Royal Army Medical Corps

Local News

ENGLAND AND WALES

The King's Fund

The King has been pleased to become Patron of King Edward's Hospital Fund for London His Majesty has appointed H R H the Duke of Kent President of the Fund, the appointment of His Royal Highness having been recommended by the Lord Chancellor, the Prime Minister, and the Governor of the Bank of England, in accordance with the Act of Parliament

Research in Dairying

The last annual report of the National Institute for Research in Dairying University of Reading, states that recent activity in the dairy industry has been reflected at the Institute by an increasing demand for advisory services Many requests for information involve minor investigations, and some indeed require thorough and complete research Nevertheless, despite the additional burden imposed by these duties, there has been a considerable output of original work during the twelve months under review, and summaries of forty eight scientific papers are appended to the report It is stated that contagious abortion discovered by blood test reactions and by premature calvings was found to exist in the Institute's herd in the autumn of 1933 After the lapse of a year, despite measures of control the number of infected cows had markedly increased, and it was decided to continue blood tests of all negative cows at monthly intervals and of in calf heifers at wider intervals, and to segregate the negative from the positive stock as far as possible This policy was pursued during 1935, but it is stated that a number of negative animals have become positive, and that several cows have aborted before giving a positive reaction No adequate explanation of the original source of infection has been found, and it is noted that it is ten years since fresh cows were introduced into the herd, while all bulls have given negative reactions to the blood test The problem is being intensively studied with a view to obtaining information which may help towards the eradication of the disease The experimental work of the Institute covers a wide range Recent improvements in the technique of artificial insemination have been studied giving a good proportion of effective results, though it has been found that semen does not remain fertile if kept more than forty eight hours In the course of nutritional investigations it was demonstrated that as a result of feeding cows during the winter months on 2 lb per diem of cacao shell an inexpensive by product of another industry the vitamin D content of the milk was raised to summer level In a comparison of the vitamin D content of butter made from the milk of Guernsey and shorthorn cows living under identical conditions it was found that the ratio of vitamin D secreted was 1 7 to 1 between Guernseys and shorthorns Work is being carried out on the standardization of cheese with a view to replacing the present empirical method of grading by a more scientific procedure

Blood Transfusion Service in Leeds

It appears from an article in the *Yorkshire Post* that notwithstanding a campaign early last year to recruit blood donors for transfusions at the General Infirmary at Leeds and other medical institutions and nursing homes in that city there is still a serious shortage of volunteers The difficulty mainly concerns one group of donors (Group 4 universal), and the position has been worsened by the number of recent resignations from the transfusion service There are nearly 400 donors on the list but only about a third of the volunteers belong to Group 4 Valuable help is being given to the local transfusion service by the Leeds Rotary Club

SCOTLAND

Glasgow Western Infirmary

Colonel D J Mackintosh who has been medical superintendent of Glasgow Western Infirmary for forty four years has now been appointed consulting medical superintendent and his assistant Dr Loudon MacQueen has been promoted to the post of acting medical superintendent Colonel Mackintosh after a preliminary education at St Andrews studied medicine at Glasgow University and graduated M B, C M in 1884 After holding resident posts he was appointed medical superintendent of the Victoria Infirmary of Glasgow when it was opened in 1890 and two years later he was selected for the corresponding position at the Western Infirmary Before the war he had been an active officer in the Territorials and during the war he supervised the military hospitals in the Glasgow area He afterwards received the decorations of C B and C V O and the degree of LL D from Glasgow University in 1912 He has taken an active part in State inquiries into hospital administration and services and has been widely consulted in regard to the construction of various hospitals His *Skiagraphic Atlas of Fractures and Dislocations* and *Construction Equipment and Management of a General Hospital* are well known Dr Loudon MacQueen who succeeds him after an education at Glasgow Academy and Loretto graduated M B, Ch B at Glasgow in 1924 and took the D P H in 1928 During the war he served with the R F A in Mesopotamia After holding resident posts, he became assistant superintendent of the Western Infirmary in 1927, and has held this appointment since that time

Edinburgh Royal Infirmary

The annual meeting of the Court of Contributors to the Edinburgh Royal Infirmary for consideration of the annual report on the work of the institution was held on January 4 The total ordinary income had amounted to £129 020 while the ordinary expenditure had been £169 694 The latter showed an increase over the expenditure for the previous year of £12 996 and it was noted that the ordinary expenditure during the course of the past ten years had increased by £40 000 These figures, it is stated had caused the managers grave concern, especially in view of the enlargement of the hospital, which would preclude any possibility of reduction being effected in the future The principal reason for the increase of expenditure during the past year had been the addition of the new building for dermatological and venereal diseases which was opened last summer The average cost per occupied bed had been over £175 as compared with £167 ten years ago while the average cost per patient per day had been 9s 7½d and the average cost per patient treated had been £8 4s 8d The amount of extraordinary expenditure had been £28 532 of which £20 625 had been on account of payments made for the new department for dermatology and venereal diseases There was thus a total deficiency of £77 006 which however had been met by legacies and special donations for general purposes amounting to £78 639 The number of in patients treated had been 21 568 as compared with 20 695 in the previous year The daily average number of in patients had been 965 5 as compared with 9 6 4 in the previous year, and the average length of stay had been 17 14 days as compared with 17 26 days Of the patients treated 9 506 resided in Edinburgh while 11 169 came from country districts In addition to the patients treated in the wards out patients to the number of 72 543 had been treated an increase over the figures for the previous year of 4 960 and the number of attendances by these patients had reached the total of 379 688 which represented a daily attendance throughout the year of well over 1 000 out patients It is pointed out that the number of cases admitted as the result of motor traffic accidents had been 415 an increase of forty nine over those of the previous year, while a further 587 motor accident cases

became an indefatigable critic of the existing methods pursued by anthropologists, Egyptologists, and classical scholars He published about fifty papers on anatomical subjects, described the brains of living and extinct forms from whales to lemurs, surveyed Nubian cemeteries and royal mummies, became interested in the origin and practice of mummification and the religious beliefs and customs of the ancient Egyptians He spent his vacations with Maspero, director of Egyptian antiquities, Sir Armand Ruffer, Wood Jones and others and began publication of the anatomical reports of 20,000 burials, undertaken by the Archaeological Survey of Nubia Much of our knowledge of ancient customs and of palaeopathology we owe to his astounding energy In 1907 he was elected a Fellow of the Royal Society

In 1909 Elliot Smith succeeded Young in the chair at Manchester He soon became involved with Rivers and W J Perry in the problems of the early origins of magic and religion and of the early migration of man This collaboration led to that gradual unfolding of the doctrine of diffusion of culture from ancient Egypt which brought Elliot Smith into antagonism with so much of existing ethnological and anthropological tenets That vigorous process of thought, with an occasional smashing and devastating blow at existing beliefs made Elliot Smith beloved of the younger men, but anthropologists and historians trained in the ponderous circumlocution of the classical tradition did not suffer gladly He was merciless to "the active privy counsellors of the board of confusion" His belief in the newer inductive methods of human biology ran counter to the traditions of the deductive school of Descartes—helplessly attempting to fit man's activities into the laws of nature

While pursuing these varied lines of work the discovery of Piltdown Man brought Elliot Smith into close contact and occasional differences with Sir Arthur Smith Woodward and Sir Arthur Keith Amidst this welter of work he delivered the Arris and Gale Lectures before the Royal College of Surgeons on the evolution of the brain in 1909, served on the General Medical Council from 1913 to 1919, collaborated with Rivers and T H Pear in the treatment of shell-shock during the great war, fired the Manchester Literary and Philosophical Society with his radical outlook, received the Royal Medal of the Royal Society in 1912, and delivered the Croonian Lectures at the Royal College of Physicians in 1919 on the significance of the cerebral cortex

In 1919 the late Ernest Starling persuaded Elliot Smith to accept the chair of anatomy at University College, London, in succession to Sir George Dancer Thane From 1919 to December, 1932, when he was partially incapacitated by a stroke Elliot Smith threw himself into the activities of the new Institute of Anatomy made possible by the munificent benefaction of the Rockefeller Foundation He put into practice his views on the significance of anatomy Special practical courses in histology, embryology, neurology, and radiological anatomy were instituted Physical anthropology and, to a certain extent, cultural anthropology were taught and fostered Active liaisons were formed with University College Hospital and with the prosectorium of the Zoological Society He scattered his demonstrators to chairs in the colonies, he attracted post-graduate research workers, he welcomed colonial resident magistrates, medical officers, and men of varied interests He championed John I Hunter and Royle of Sydney when they revived interest in the sympathetic system and its surgery He became the interpreter of discoveries in relation to the early history of man He stimulated research in so many fields, and prepared his assistants to profit by the unexpected Dart in South Africa discovered the Taungs ape, Davidson Black in Pekin the Pekin skull He visited America, Indonesia, Java, and China In each place he was the missionary, and was largely responsible for winning the interest of the Rockefeller Foundation in anthropological and anatomical research in China, India, and Australia

His publications in anthropology, Egyptology, and ancient history continued, and he became the centre of many a storm From 1932 until his retirement from the chair of anatomy in September, 1936, he contended cheerfully with much disability As a scientist he rated the honorary Fellowship of St John's College as highly as his Fellowship of the Royal Society His services to the Empire and to the world of science were graciously recognized by the bestowal of a knighthood in 1934 On January 1, 1937, he died at Broadstairs, and was cremated on January 5 at Golder's Green, London

Sir Grafton Elliot Smith by constitution and upbringing was magnificently prepared for the brief largeness of life His intuitive genius was equalled only by his kindness and generosity to the young anatomists, physiologists, and anthropologists on the threshold of a career He was a handsome figure of a man, endowed with charity and good humour, affectionate to the unfortunate, generous to the point of self-neglect To have lived and worked in the closest association with him from 1919 to 1934 was one continuous post-graduate course in human biology in the broadest sense of the term The breadth of his erudition is shown in *Essays in Evolution* (1927) and *Human History* (1930), his provocative acumen in *The Evolution of the Dragon* (1919) and *Elephants and Ethnologists* (1924)

When honours fell thick upon him from various societies at home and abroad he remained the same simple soul, delighted with a story, intrigued by any sign of radicalism in medicine as a whole, ready to discuss the prophecies of Ezekiel and the Psalms or the latest portrayal of tribal customs on the films His boyish interest in all his students, demonstrators, and friends, his regard for the technical staff, his kindness to the man in the street, Twickenham on the day of an International or the university Rugger match, the lecture to a working-class audience, the hand extended to anyone in trouble—these are the things which come to mind His genial qualities and happy family life earned him the friendship of a wide circle of friends, and his innate modesty served as a continuous brake upon some of his younger associates

In saying farewell to Elliot Smith one mourns not only the loss of a great master but the passing of a kind and generous soul whose desire was ever to enrich by laboratory research the wide and cheerful stream of life He was not afraid of being rebuked by the academically minded for encroaching upon foreign ground, for he had too often experienced that though the roots of a solid undertaking may be bitter the fruit may be sweet He had a keen eye for engravings and etchings, and was interested in the first anatomical woodcuts His knowledge of the art of Egypt and Indonesia was unique His familiarity with the voyages and travels of ancient times, his astounding visual memory, his ability to throw life into inanimate objects and bring them into unexpected relations, made a lasting impression on all who were fortunate enough to pick a few of the crumbs which ever dropped from his table

H A H

[The photograph reproduced is by Elliott and Fry, Ltd]

leishmania parasites with negative results Two species of sandflies belonging to the major group, *P squamipleuris* and *P perniciosus* were found in the endemic areas Grey monkeys were susceptible to experimental infection intradermally, subcutaneously, and intraperitoneally, and could be infected by nasal spraying Dogs were infected with difficulty, two series of contact experiments carried out in an insect-proof room showed that the disease could be transmitted from infected to healthy monkeys The epidemiological data obtained indicated lines for the control of kala azar in the Sudan even if the problem of transmission as in other countries still remained unsolved Certain aspects in the epidemiology of the disease in the Sudan afforded a promising field for future research on the problem of transmission

General Discussion

Sir RICKARD CHRISTOPHERS, in opening the discussion, referred to the curious distribution of kala azar which could not be associated with any climatic conditions The Mediterranean type of the disease was different in many aspects from the Indian type and he would like to know to which type the Sudan disease conformed—the feature in favour of resemblance to the Indian condition was the absence in the Sudan of the canine disease He drew attention to the importance of examining sandflies for infections of the proboscis Dr C M WENYON referred to the method of transmission of kala azar He did not think that because viable parasites had been discovered in faeces, urine, and nasal secretions of cases of kala azar that was proof that the disease was contagious

Dr Wenyon also read a communication from Dr ADLER who pointed out that in his opinion contagion, if it ever occurred in this disease was merely an accident He felt that if the transmission was by contagion the disease would be universal and not limited to special areas The association of kala-azar with sandflies of the *P major* group was too close to be accidental This had been his experience in Catania and Naples, while in Crete at Canea only 350 metres separated a kala azar area from another area where it did not appear, and this distance also separated the area where a sandfly of the *P major* group (*P perniciosus*) occurred from the other from which it was absent He did not think that direct transmission of leishmania from man to man or from dog to dog could maintain the disease for any length of time

Colonel J A SINTON remarked that in India long ago it had been noted that the spread of the disease was related to a close association between the sick and healthy and that a removal of healthy families to new houses a mere three hundred yards away was sufficient to check the disease This fact seemed to be more in favour of transmission by an insect with a limited range than by passage of infection directly from person to person Sir JOHN MEGAW, in view of Sir Rickard Christophers's remarks about the possibility of contagion wished to emphasize the strictly local distribution of the disease as distinctly against any such view Dr MANSON BAHR drew attention to the curious patchy distribution of the disease, an explanation of which seemed to be as elusive as those for the irregular distribution of birds Dr J W LINDSAY referred to the distribution of cutaneous and muco-cutaneous leishmaniasis in South America and noted that during the past year or two the practice of examining portions of liver obtained at necropsy from cases which had died of suspected yellow fever had recorded forty one instances of leishmania infection a discovery which appeared to indicate that kala azar was present in Brazil Air Commodore H E WHITTINGHAM said he had recently seen a case of kala azar contracted in the Aden Protectorate in an officer of the Royal Air Force who had not been out of the Protectorate for eighteen months though he had served in India five years previously The sandfly *P perniciosus* was known to occur in Aden Sir ROBERT ARCHIBALD in reply agreed that the Sudan disease appeared to resemble that of India rather than that of the Mediterranean As regards sandflies, he had dissected about twelve hundred and in so doing had not neglected to examine the proboscis No instance of infection with flagellates was encountered As regards the method of transmission he still had an open mind, though he considered that too much emphasis had been given to the theory of sandfly vector

BLOOD PHOSPHATASE IN BONE DISEASE

At a meeting of the Royal Medico Chirurgical Society of Glasgow on December 18th 1936, with the president, Mr G H EDINGTON, in the chair, three papers were given

Dr NOAH MORRIS discussing The Significance of Plasma Phosphatase in Bone Disease and Jaundice said that since Robison's work on phosphatase had been applied to clinical conditions variations in plasma phosphatase had been studied in numerous pathological states especially those affecting osseous tissue The presence of that ferment in the blood might be taken as a rough estimate of its production in the tissues but it was quite possible that an increase might be due to diminished utilization in its place of origin Plasma phosphatase was markedly increased in Paget's disease generalized osteitis fibrocystica moderately raised in rickets, osteomalacia, and bone cancer, and slightly above normal in osteoporosis and osteopetrosis In multiple cystic tumours of bone a great increase in plasma phosphatase might be of considerable assistance in determining whether or not there was over production of the parathyroid hormone, and therefore whether operative intervention was required It was not of much value in the early detection of either Paget's disease or osteitis fibrocystica since changes were generally seen in the skiagram before the phosphatase was increased

An analysis of phosphatase estimations in a group of 500 infants and young children showed that while in a small number of cases the phosphatase was not increased even in the presence of clinical and radiographic signs of rickets there was on the whole a moderate degree of correlation between the height of the plasma phosphatase and the severity of the rachitic condition In untreated active rickets the phosphatase continued to increase and a stationary value might be taken as evidence of early healing The rate of fall depended on the dosage of vitamin D The estimation of plasma phosphatase had a place in the diagnosis of the pre clinical stage of rickets but could not by itself be used to indicate in the individual patient either the severity of the rachitic process or the presence or absence of healing

Phosphatase Estimations in Jaundice

While it was true that the phosphatase was generally very much increased in cases of obstructive jaundice, but moderately raised in toxi infective and within normal limits in haemolytic jaundice Dr Morris said there was such an overlap of figures that the determination of plasma phosphatase was of little value in making a decision as to the nature of the jaundice Clinical data obtained in association with Mr A B Kerr showed that removal of bile by means of a bile fistula might lead to a pronounced increase in the plasma phosphatase without causing a significant alteration in the bilirubin content of the blood It was known that the absence of bile from the duodenum led to a defective absorption of lime Personal experience had indicated that a calcium poor diet caused a marked increase of plasma phosphatase It was suggested therefore that in jaundice and other conditions an increase in plasma phosphatase occurred whenever the retention of lime was insufficient to meet the demands of the osseous tissue

X-Ray Dosage in Cancer

Dr FERGUS L HENDERSON in a short paper on X Ray Dosage with Reference to Malignancy discussed the difficulty in the accurate measurement of x ray doses and

was appointed a member of the Union of South Africa Medical Council in 1928 He retired from his official posts in 1932

HARRINGTON SAINSBURY M D, F R C P

Consulting Physician Royal Free Hospital, and City of London Hospital for Diseases of the Chest

Dr Harrington Sainsbury who died in his eighty-fourth year on December 29, 1936, was formerly well known in the medical world of London as an authority on diseases of the heart and lungs

He was born on May 23, 1853, and after school days on the Continent studied medicine at University College, London, graduating M B Lond, with honours in forensic medicine, in 1879, and proceeding M D a year later He obtained the M R C P in 1881, and was elected F R C P in 1892 Dr Sainsbury was for many years physician to the Royal Free Hospital and to the City of London Hospital for Diseases of the Chest, he was also examining physician for the Royal National Hospital for Consumption and Diseases of the Chest at Ventnor He served for some years as examiner in medicine for the Society of Apothecaries of London

A scholarly writer with a genuine love of science, his best-known works were *Principia Therapeutica*, a book published in 1906, *Drugs and the Drug Habit* (1909), *The Heart as a Power Chamber* (1922), and *The Cardiac Cycle* (1931) The last of a number of papers contributed to these columns was "State of the Artery and the Circulation under the Sphygmomanometer Cuff During Compression,' in our issue of February 2, 1929 Under the name of Hillel Samson he wrote three short romances, two of which were published at the Cayme Press by his son

Dr Sainsbury joined the British Medical Association at the beginning of 1881 He did good work during the war at Richmond and Bermondsey, and at the Military Hospital in Endell Street For these services he received the O B E in 1919

SIR JOHN BLAND-SUTTON

Professor LAMBERT ROGERS writes

It is a very curious thing—and incidentally this phrase was a favourite opening of Sir John's when he was about to refer to something which interested him—that although several excellent accounts of his life and work have appeared there have been but few stories of those personal contacts which might portray his distinctive personality to those who knew him only from the benches of the lecture theatre or from his vivid writings

When in the dissecting-room I was tempted one afternoon by some of my co-dissectors to cross over to the hospital to see Bland-Sutton operating As I had only once before seen an operation performed the whole scene remains clear cut in my memory The patient was on the table, the anaesthetist at work, the assistants and theatre staff grouped around, when very quietly a rather stout little man, wearing glasses button-up boots and a short-sleeved gown which displayed bare arms above his rubber gloves, entered the theatre He had opened the door himself, turning the handle by grasping it through a shield made by picking up a fold of his gown He walked straight to the patient, picked up a scalpel made a single midline incision into the peritoneum, and putting in his little hand—he wore only a size 6 glove—produced a large ovarian cyst and looking up to us remarked 'There it is gentlemen as large as a football' Later it was my privilege to become one of his dressers His teaching was characteristic He never 'spoon-fed' us, but as I realize now tried to instil into us the power of observing H: would come to a patient and say, "Who is the dress of this case?' One of us would reply "I am, Sir Sir John would then say "Read the notes," and he would listen carefully, only very rarely making any comments until the dresser finished, when he would ask him, "What do you think it is?" To whatever reply the dresser made Sir John would say, "We'll see on Wednesday" (or Satur day, these being his operating days) He had, of course, already studied the case, concluded his examination, and formed his opinion, but in not dogmatically discussing the points with us he taught us to observe for ourselves and to correlate our findings with what was displayed by him on Wednesday or Saturday

I do not remember ever seeing him laugh, a twinkle of amusement might just be caught in his eyes at time but this is doubtful, and a fellow dresser with me on... said "He is like a sort of idol his face is always the same" He would stop in the course of the ward round to ask if we had ever dissected an orchid or to present each of us with a little copy of one of Shakespeare's plays, and as he handed me *King Lear* he remarked, "Are you learned enough to read *King Lear*?" I recall a ward sister's consternation when followed by "the firm" he wandered one afternoon into the infants' ward, and after looking at several babies said "They are exactly like little gorillas, Sister"

He often used to tell us not to do as he did, the reason being, I think, that his methods were frequently unconventional, and while safe in his expert hands might have been dangerous in the hands of those who were inexperienced and less familiar with operative surgery As he opened the abdomen with one sweep of his scalpel he would again and again say to those of us around him "Don't you do as I do" When operating on the kidney one day I remember his asking, "Do you ever think when your breakfast kidneys are tough that the animal probably had chronic interstitial nephritis?" Another favourite comment on the kidney was that you could get on without brains but not without kidneys

Bland-Sutton's name occurs in textbooks of descriptive anatomy in connexion with the Y-shaped ligament at the ankle, also known as the fundiform ligament of Retzius, and in connexion with accessory sphenoidal ossicles, which have been termed "ossa Bland-Suttoni" It will be remembered widely in comparative anatomy, in pathology and in surgery but those of us who were his dresser and came near to knowing our great imperturbable chi will remember him with pride, with affection, with wonder for what he was, and with gratitude for having had the opportunity of serving with him

Mr GORDON GORDON-TAYLOR writes

Perhaps a few lines may still be spared to one who was an old assistant surgeon of Sir John Bland Sutton at Middlesex Hospital, and who chances to be in surgica charge of the ward in the hospital which bears the name of the distinguished surgeon whose death we deplore From former colleagues and from other distinguished surgeons who had come under his spell appreciative notices have already appeared in your columns penned in words far more eloquent than mine, but none I think, has done quite full justice to the really extraordinary dexterity, th craftsmanship, and the operative celerity of the man, mor especially in the surgery of the female pelvis, the branc of surgery which, as has already been pointed out by others, he did much to found and which he advanced and adorned

Correspondence

Physical Medicine

SIR—I cordially agree with Dr A Gordon Watson (*Journal* December 19 1936, p 1288) and Dr Alfred Cox (January 2 p 43) that physical medicine like all other branches of medicine, should enjoy university teaching since practice without teaching is in every way disadvantageous One branch radiology has already escaped from this anomalous position with enhanced efficacy and prestige The British Balneological and Climatological Society recommended university teaching in the subjects in which it was interested so long ago as 1897 But I always hoped that the University of London, to which with all external students I was so much indebted, would consent to supply this want After all it is the central university of the Empire, as the new buildings will presently convince us For many years students from all the British possessions have found within its portals the special teaching and qualifications which they required, even in subjects the most recondite and least sought after Facilities were especially offered for the neglected departments of knowledge

I sometimes wonder what would have been the long result if the scheme of teaching that was laid before the Senate by Sir Wilmot Herringham in 1914, and prevented by the war, had gone through I still hope that it may be possible for the University to meet the deficiencies in the teaching of physical medicine That great province includes many nearly independent specialties and branches of practice May I suggest that perhaps the best solution would be to institute diplomas for proficiency in these branches severally The question of the demand for this or that special teaching is beside the point, but rather what is needed Education is not always demanded a supply of materials sometimes creates a demand—I am, etc,

London W 1 Jan 3 R FORTESCUE FOX

Benzedrine

SIR—In your annotation on the use of benzedrine (*Journal* December 12, 1936, p 1204) you state that The drug also causes a rise in the red and white cell counts The increase in red cells produced by the pharmacologically related substances adrenaline and ephedrine is recognized, and in some experiments on guinea pigs (*J Pharmacol* 1936, 56 389) Dr B H E Cadness and I concluded that ephedrine probably causes extrusion into the circulation of erythrocytes leucocytes, and platelets from the storage and haemopoietic centres, including the bone marrow These effects of ephedrine were also observed after splenectomy A single dose of 2 grains (120 mg) by mouth produced in my own blood a rise of erythrocytes from 5,370 000 to 6 230,000 the change persisting for some hours A cumulative effect may have been responsible for the high figure of 10 millions in the case quoted

Dr D M O Connor in his letter (*Journal* January 2, p 43) states that a patient, taking benzedrine experienced increasing difficulty in voiding faeces and urine This symptom is also part of the toxicology of ephedrine In my own experiment about ninety minutes after taking 120 mg. of ephedrine by mouth, an urgent desire to micturate was associated with a painful sensation at the end of the penis and an aching of the testicles which tended to retract into the abdomen Nevertheless it was found impossible to pass any urine, but at the end of three hours the painful sensations passed off and a copious diuresis occurred Similar sensations were experienced by a laboratory assistant after taking 90 mg of ephedrine

The undoubted exhilaration and increased motor and mental hyperactivity were followed by a sense of extreme exhaustion and a rapid pulse It would appear as if nature demanded compensation for the period of artificial stimulation Unfortunately insomnia was a paradoxical and exasperating association of the fatigued state Incidentally the therapeutic stimulating effect of insulin hypoglycaemia in schizophrenia etc may be partly due to the secretion of adrenaline which may continue for some hours (*Proc roy Soc Med* 1936 29, 26) If so this therapy would be comparable to that of ephedrine and benzedrine—I am etc

S LEVY SIMPSON

London W 1 Jan 2

The Influenza Epidemic

SIR—The present epidemic of influenza over the whole of Europe recalls the great epidemic of 1918 At the present time the cases are not of the fulminating type with severe lung complications such as were observed in 1918 under the mental strain and malnutrition consequent upon the long duration of the war

I quote a typical history of a case of influenza which I have observed recently and which shows some special and some characteristic features

The patient was a healthy girl of 16 The temperature chart showed a sudden onset of the illness with rigor and a temperature of 102 F At the same time a focus was observed in the right tonsil which contained fusiform bacilli and spirochaetes only On the next day the patient complained of pain under the sternum and of irritating sneezing and coughing By the third day the temperature had gradually risen to over 105 and at the same time upon percussion a slight dullness could be heard over the right lower lobe The pulse rate at the start was 124 but this had dropped to 90 by the fourth day when a slight nasal bleeding occurred By the fifth day the temperature had dropped to 98 4 Together with the fall in temperature and pulse rate the production of a very scanty rusty sputum was observed in which a few *H influenzae* were found but no pneumococci At the same time the initial symptoms of coughing and sneezing became less marked

The patient was exhausted and became very sleepy the temperature gradually rose again and on the sixth day was 103 5 The pulse rate remained characteristically low and with the decrease in temperature subsided to 60 on the eleventh day by which time the temperature had dropped to 97 and from this time remained subnormal On the fifth day severe nasal bleeding occurred and on the sixth day *fresh blood* was seen in the sputum

At the same time as was shown by the dullness and other signs over the right upper and lower parts of the back the congestion of the lung increased On the sixth day the differential leucocyte count showed the presence of 5 per cent. polymorphs 3 per cent. eosinophils 8 per cent lymphocytes and 6 per cent monocytes On the seventh day the appearance of wet and dry rales together with crepitation over the sites of dullness marked the resolution of the congestion and on the tenth day the rales disappeared

The patient was still very weak and thrush appeared and persisted for a day on the tongue and the left side of the fauces On the eighteenth day after the patient had been out of bed for three days numerous white spots appeared on both tonsils but were not accompanied by any rise in temperature A culture revealed only the presence of staphy

QUERIES AND ANSWERS

Nocturnal Cramp

"BETA" writes Forty years ago I was advised by a postman to wear a knee-length woollen stocking in bed This I promptly did, and have not suffered from cramp since then

Income Tax

Income Accruing Abroad

"H," who is at present on foreign service asks whether he and his wife will be liable for income tax, when he is serving in the United Kingdom, in respect of income arising in Australia but not remitted here The income is applied to reducing loans made to 'H' in the voluntary assistance of a relative and in payment of life assurance premiums

*** Assuming that 'H" is not coming to the United Kingdom merely for a temporary stay he will be liable as an ordinary resident to account for tax on the income arising abroad, whether it is remitted or not There is no separate allowance due to his wife, and in effect the two incomes will be aggregated for taxation Our correspondent may, however, be entitled to some relief from this taxation—(*a*) on the amount of the premiums paid to the life assurance company, (*b*) in respect of any Australian income tax paid on the income, and (*c*) some small allowance if the assisted relative can fairly be said to be dependent" on the assistance—but this is unlikely, as the repayments of capital would have to be excluded from the calculation of the assistance

LETTERS, NOTES, ETC.

Motor Car Insurance

Mr L FERRIS SCOTT, F C A (hon secretary, Medical Insurance Agency B M A House, Tavistock Square, W C 1), writes In the *Journal* of December 26 1936, you were good enough to publish a letter, authorized by the Committee of Management of the M I A, in which I set out the revised manner of charging premiums under the Doctors Special Motor Car Policy, which is underwritten only for the M I A at Lloyd's, and the reduced rates charged owing to an increase in the rebate allowed by the M I A and an increase also in the no claim bonus granted by underwriters The Agency has received several letters from members interested and two of the questions which are asked are Is the no claim bonus allowed upon transfer from another insurance company or underwriters? The answer, of course, is Yes —that by transferring to the Doctors Special Motor Car Policy medical practitioners gain advantages and lose nothing The second question is Are the extra premiums charged for certain defined areas necessarily payable in connexion with the Doctors Special Motor Car Policy? The answer is that these are not necessarily payable, and in fact are charged by underwriters under this special policy only where the previous claims experience makes it essential For the rest the extremely low net premiums charged appear to give great satisfaction

Bromide Intoxication

Dr J E J PALSER (Muswell Hill) writes The paper on bromide intoxication in your issue of November 14 (p 957) and 'B P s" inquiry (December 12, p 1242) about the occurrence of this condition in epilepsy, and the experience of medical officers of asylums and institutions for epileptics, prompt me to record the following During an appointment which I held for seven months in 1930 and 1931 on the staff of a mental hospital a middle aged female epileptic imbecile, who had long been receiving the usual doses of potassium bromide, became gradually stuporous developed constant minor twitchings, sank into coma, and died About two months later I came across Wagner and Bunbury's paper (*J Amer med Ass* 1930 95, 1725) which is quoted in the recent paper in the *B M J* and the probable significance of the above case at once occurred to me The same volume of the *Journal of the American Medical Association* contains accounts of bromide intoxication (not quoted in the recent *B M J* paper) on pages 84 (Harris and Hauser) and 826 (Andrews, quoted from *Virginia Medical Monthly*, 1930, 57, 304) At about the same time as the above mentioned case a middle aged or elderly female psychotic (non epileptic, non imbecile) patient, who had been receiving barbitone for a long time, became stuporous and died without definite physical signs of disease It is perhaps difficult in mental cases to tell whether such deaths are due to sedatives or to the mental condition

The Earliest Sanatoria in England

Dr RICHARD J CYRIAX (Leamington Spa) writes Dr George Bodington (1799-1882), of Sutton Coldfield, Warwickshire, is generally, if not universally, recognized as the pioneer of the sanatorium treatment of pulmonary tuberculosis, and if this claim is admitted the institutions in which he carried out this treatment must be regarded as the earliest sanatoria in England His methods, which consisted principally of exposure to fresh air, graduated exercise, and a nutritious diet, were fully described in his book *An Essay on the Treatment and Cure of Pulmonary Consumption* (1840) He was practising them in 1833, but may have done so previously In 1836 he became the proprietor of a private lunatic asylum at Driffold House Sutton Coldfield, and his writings afford definite evidence that during the next few years he received there as resident patients cases not only of insanity but also of phthisis He then rented the White House, Manor, near Driffold House, for the reception only of cases of phthisis, it was ready for their occupation, if not in actual use, in January, 1840 He is known to have received some cases of phthisis at the White House, but closed it in 1842 or 1843, and then devoted himself entirely to his insane patients at Driffold House Driffold House was thus the parent institution, but the White House seems to have been the first to be used *solely* for the sanatorium treatment of pulmonary tuberculosis, and hence to have been the earliest sanatorium in England Both these houses have recently been pulled down Photographs and descriptions of them appeared in the *British Journal of Tuberculosis* January, 1925

False Calls for London Ambulances

Medical practitioners will be glad to know that any person who gives false information which would reasonably lead to the dispatch of one of the London County Council's ambulances is now liable on summary conviction to a penalty up to £25, unless he can satisfy the court that he had reasonable cause to believe that his information was correct This provision has been obtained by the L C C under its General Powers Act of 1936, in view of the large and growing number of false calls, which may have been malicious in origin, received in the last few years by the London Ambulance Service

Corrigendum

Owing to an error in the preparation of Dr L E Houghton's article— Blood Examinations in Pulmonary Tuberculosis" —which was published in the *Journal* of December 19, 1936 "blood count was printed instead of "Bonsdorff count" in the first four tables under the heading "Prognosis"

to be more likely in these two cases that the delayed reaction would have set in whether the operation had taken half an hour or one hour and that the death from heart failure was a direct result of the strain of the reaction on a weakened myocardium

As after a blood transfusion of one pint the haemoglobin percentage only rises by 8 to 12 it seems unlikely that a further factor complicating transfusion reactions is the sudden rising of the haemoglobin percentage of the blood according to Dr Leigh Silver's theory

Professor Baker and Professor Dodds in connexion with a statement of mine on our ignorance in regard to the renal changes in cases of uraemia following blood transfusion refer me to their experimental and chemical study of the question in the *British Journal of Experimental Pathology* (1925 6, 247) I had previously studied this excellent work with great interest and I regret that lack of space did not allow amplification of my statement with reference to their article

It seems to me however that the exact nature of the substance in the renal tubules still has to be determined for although by experimental work in rabbits they produced a similar appearance in the kidney their exact analyses were concerned with a substance in the urine Moreover as these authors themselves say a similar condition should often occur in paroxysmal haemoglobinuria—an objection which they explain in the following words It is reasonable to suppose that in paroxysmal haemoglobinuria and blackwater fever the amount of haemoglobin set free during any one attack is as a rule small compared with that liberated in a patient transfused with incompatible blood To my mind this is an unreasonable assumption Further in some cases of death from uraemia following transfusion showing the typical appearance of pigmented debris in the tubules there is no evidence of haemolysis as shown by jaundice or in one case even by van den Bergh tests (Witts L J *Lancet* 1929 **1**, 1297 De Gowin E L and Baldridge C W *Amer J med Sci* 1934 **188**, 555 Bordley J *Arch intern Med* 1931 **47**, 298)

—I am, etc,

London W1 Jan 4 N S PLUMMER

SIR,—May I correct any misunderstanding that may exist regarding a side issue in my letter on blood transfusion fatalities (*Journal* December 26 1936 p 1333) Transfusion of saline solutions by various methods has of course been used for some time, I believe however the particular method of blood transfusion described by Drs Marriott and Kekwick using more than one donor, to be the first of its kind, in this country or elsewhere —I am etc,

A L LEIGH SILVER

Medical Department Royal Arsenal
Woolwich Jan 3

Prevention of Silicosis

SIR,—If a national industrial health service is ever established silicosis should be one of the first complaints to engage its attention In the mortality tables for 1935 the number of deaths from chronic interstitial pneumonia including occupational diseases of the lung is given as 367, but that modest figure should not be regarded as an index of the harm done by breathing particles of silica

The coal miner is usually exempt from this disease and yet the post mortem appearance of a collier's lungs indicates that millions of particles of coal dust have become embedded in the lung tissue without any obvious disadvantage In spite of popular opinion to the contrary if we exclude deaths from accidents, it cannot be said that a miner's occupation is unhealthy I write from experience, for I practised among them for twenty one years It is true they are shut off from sunlight, but they have many compensating advantages which need not be discussed here In the mortality figures for the various trades and professions the miner occupies a good position The statistics show that he lives as long as builders and commercial travellers The question naturally arises Why can a coal miner have his air cells bombarded with coal dust and take no harm, while a stone grinder ultimately dies from breathing silica dust? The usual answer is that the sharp particles of silica inflict minute wounds in the lung tissue and germ infection follows That explanation is no doubt partly true but it has never wholly satisfied me I believe the immunity enjoyed from coal dust penetration is largely due to its antiseptic properties The bane and the antidote are administered together When wounds are inflicted by silica there is no accompanying germicide

If there is any truth in the suggestion just made obviously it might be possible to prevent the more serious consequences which follow the inhalation of silica particles by the simultaneous administration of a germicide This I believe, could be accomplished in a natural and unobtrusive way by iodizing the atmosphere breathed by workers who, by the nature of their occupation are compelled to inhale dangerous dust I think the plan is worthy of an extended trial in this country and I would also like to see it tried out in one or two of the South African gold mines where miners phthisis takes such a heavy toll of the natives—I am, etc

J A GOODFELLOW

Kenwood Chesterfield Dec 30 1936

Metabolic Factor in Rheumatism

SIR,—Dr R G Gordon in his interesting article on the metabolic factor in chronic rheumatism (*Journal* December 19 1936 p 1243) states his belief that the majority of cases of fibrositis are metabolic rather than infective in origin and are due to minor degrees of thyroid inadequacy and to sympathetic dystonia, both of which conditions favour the deposition of irritating metabolites in certain tissues That he does not indicate the nature of such disturbing bodies seems to imply that he has not isolated them and surely they need to be isolated before they can be considered to hold a causative relation to the commonest of all rheumatic conditions For fibrositis if not universal in its incidence is at any rate so extremely common that its cause is likely to be found among conditions which operate very widely Infection is such a cause and should not be neglected simply because the focal theory of infection often produces disappointing results

I have put forward evidence to explain why the focal theory is of little practical value in the treatment of fibrositis not because infection is ever absent but because the theory is inadequate to account for what is really happening In a short paper on A New Treatment of Fibrositis in the *Journal* of February 15 1936 I suggested that the primary focus is no more than the first stage of the disease the portal whereby organisms gain entry to the circulation and that the appearance of fibrositis denotes the further stage in which they have established outposts in the tissues Such local collections of living organisms are self sufficient and need no reinforcement for their continued existence or eventual spread to other parts I further tried to show that the resolution of such secondary foci rarely takes place without adequate local treatment by means of massage in slighter cases, and by means of oil soluble chemicals and oil

of large infarcts and when anuria is present Treatment can only be symptomatic when the diagnosis has not been established If complete urological examination has confirmed the diagnosis of infarct of the kidney, nephrectomy may be carried out provided the affected kidney has ceased to function and the other kidney is normal When nephrectomy is not advisable or when the infarct, although large, does not interfere with the function of the kidney, decapsulation will often be sufficient for the relief of pain A detailed report of thirty-five cases is given

22 Malignant Tumours of the Testicle

B CHRISTENSEN (*Ugeskr Laeg*, September 10, 1936, p 876) contrasts his own findings with the textbook statements about the incidence of and rate of recovery from malignant tumours of the testicle and epididymis It has hitherto been taught that primary tumours of the testicle, only 3 per cent of which are benign, occur at the rate of about one per 1,500 male patients in surgical wards, and constitute about 2 per cent of all malignant tumours in males Further, it has been taught (Wasserman) that the results of simple castration are so discouraging that less than 6 per cent of the patients survive four years The author's own observations do not tally with these figures In the sixteen-year period 1919–1935, in the surgical wards of the public hospitals in Copenhagen, there were eighty-one patients with supposedly malignant tumours of the testicle among a total of 52,046 adult male patients This is equivalent to one case of malignant tumour of the testicle per 643 male surgical cases During the past eleven years the author has observed in his own hospital eleven cases of malignant tumour of the testicle, an incidence of one per 550 male surgical cases It therefore seems that the present frequency of this condition is considerably greater than it used to be if textbook statements are accepted as true The recovery rate after operation, usually followed by intensive x-ray treatment, was in the author's material relatively high Five of his patients did indeed die within a year of the operation (castration with simultaneous removal of the epididymis and a considerable length of the cord) and one died about four years later, but there remained five who were alive and free from relapse nine, seven, six, and three years, and six months respectively after the operation

Therapeutics

23 Tachycardia

FRITZ FALTITSCHEK (*Wien klin Wschr*, November 20, 1936, p 1432) divides tachycardia into two main groups the functional and those caused by organic diseases of the heart Clinically he distinguishes two forms of tachycardia—namely, the Bouveret-Hoffman type of "tachycardie a centre excitable" in which the attacks may start suddenly and spontaneously with no evident cause, and the "extrasystole a paroxysms tachycardiques," characterized by onset of chains of extrasystoles A more precise classification of palpitations is supplied by the electrocardiogram According to the cause and form of electrotachycardia we distinguish an auricular and sinus T type and a ventricular type The two main factors in treatment are the vegetative nervous system and the specific cardiac nervous system The best results are obtained from remedies which stimulate the vagus while they depress the specific cardiac nervous system Of the mechanical remedies, sino-carotid pressure often fails Acetylcholine and choline are too dangerous when used in effective quantities Emetics such as apomorphine and copper sulphate may prove successful In some cases injections of a 50 per cent solution of glucose may bring about the end of an attack But the most efficient remedies are quinine and digitalis Digitalis stimulates the vagus and depresses the automatic cardiac centres, and is therefore the ideal remedy The dosage, however, must be carefully watched, as large doses of digitalis may give rise to ventricular tachycardia, while large doses of quinine are contraindicated in severe myocarditis

24 Haemorrhagic Nephritis

Z V BÓKAY (*Med Klinik*, November 13, 1936, p 15[illegible] advises the use of an exclusive carbohydrate diet, particularly of sugar, in haemorrhagic nephritis This diet is justified for several reasons It acts as a detoxicating and neutralizing agent It influences favourably the vegetative nervous system and the mineral metabolism It stimulates the function of the liver and increases the diuresis Apart from this, it increases the respiratory and perspiratory functions of the skin The treatment is carried out in the following way (*Med Klinik*, November 20, 1936, p 1592) The patient is given no water at all He is given 250 to 400 grammes of barley sugar or commercial grape sugar a day until improvement occurs, and then is allowed a sugar and fruit diet and a small quantity of water, this to be followed later by a mixed diet The therapeutic results were very good The development of chronic nephritis was prevented and the patients stood the sugar diet very well The author deprecates the use of diuretics In cases of uraemia he advises lumbar puncture He also believes in the efficacy of blood-letting in certain threatening cases In most desperate cases decapsulation of the kidneys may prove a life-saving measure He considers a milk diet superfluous or even dangerous Attention should be paid to teeth and tonsils

Dermatology

25 Kaposi's Disease

M F BLANCO (*Rev med lat-amer*, September, 1936 p 1414) records the case of a man aged 80 who presented the typical lesions of Kaposi's disease or xeroderma pigmentosa Biopsy of a tumour the size of a hazelnut showed the presence of superficial ulceration, atrophy of the epidermis, and infiltration and oedema of the corium associated with very dilated and oedema of the c vera associated with very dilated and thin-walled b vessels The elements of the new growth were fusif and were arranged in bundles with a stroma conta small interstitial haemorrhages The patient was t by radiotherapy, but without any obvious improveme

26 Juvenile Acne

M CARLE (*J Med Lyon*, November 5, 1936, p 693) regards with equal scepticism the old view which attributes juvenile acne to hepatic dysfunction and the recent view which—on the evidence of animal inoculations from the lesions or from the patients' urine—would regard it as due to infection by a tubercle bacillus or tuberculous ultravirus It is certain, he says, that juvenile acne affects an epidermis altered by seborrhoea, that the follicles contain bacilli or cocci—usually *Staphylococcus albus*, and that the lesions appear at puberty, more commonly in females, and then more usually in combination with dysmenorrhoea or ovarian dysfunction It often coincides with dyspepsia, gastric atony, and hypochlorhydria, more often still with chronic constipation Finally, it is possible that acne is most common in those with endocrine disturbance, and is specially associated with morbid utero ovarian conditions, and that in the pre tuberculous acne assumes an indurated and later cicatricial form resembling the tuberculides Carle, in preference to dietetic restrictions and regimes, protein therapy, vaccine therapy, or specific anti-tuberculous medication praises the old methods of treatment, which, aided by fresh air and change, he has found nearly always effective with five or six weeks The patient is strictly enjoined not squeeze or scratch the comedones or pustules At night the patient applies to the papules and comedones, with brush Vidal's lotion (15 grammes precipitated sulp

it would I fear, be asking too much to expect the Editor of this *Journal* with its wide—and hence relatively unspecialized—scope to publish ninety seven correlation tables which would themselves occupy some twelve pages A fuller analysis of the material is in progress under the auspices of the Scottish Council for Research in Education and on completion it is hoped to publish all the relevant data

Whether 'ability' or 'acquirement' is the more important character is a very controversial matter into which I must firmly decline to be dragged As one of my colleagues has put it The examinations seem to be reliable tests but *what* we are examining I don't know I doubt whether this analysis can help us very much to clear up this particular point

May I take this opportunity of correcting several arithmetical errors that crept into the correlations and to apologize for their occurrence

1929-30 medicine/pharmacology r = 0·45 not 0·50 medicine/therapeutics 0·48 not 0·39 surgery/bacteriology 0·54 not 0·59 surgery/pharmacology 0·47 not 0·42 surgery/medicine 0·55 not 0·49

1930-1 pathology/bacteriology 0·50 not 0·45 therapeutics/bacteriology 0·45 not 0·50

1933-4 medicine/therapeutics 0·50 not 0·55 medicine/surgery 0·55 not 0·60

A number of minor errors amounting to less than 0·05 have occurred, but as they do not materially affect the argument it is scarcely worth detailing them here——I am, etc,

Pathology Department University of Edinburgh Dec 29 1936 W GILBERT MILLAR

A Milk Epidemic

SIR—About the middle of November an epidemic of dysentery in Hong Kong was reported under prominent headlines in the newspapers in England Details which have come recently by post show that the epidemic was caused by unpasteurized milk The twenty three patients who fell ill on November 8 and 9 were all drinking unpasteurized milk from one depot of one dairy The epidemic ended rapidly on pasteurization of the milk supply The organism was Shiga's bacillus The cases were almost all young European children There were seven deaths among the twenty-three

About ten years ago there was an epidemic of typhoid in Hong Kong and the medical officer of health was satisfied that it was caused by unpasteurized milk from one dairy It is to be hoped that Hong Kong will insist on the continued pasteurization of its milk supply before a milk epidemic of cholera is added to its troubles and that Bournemouth and other places will sit up and take notice—I am, etc

Hissocks Dec 29 1936 C M HEANLEY

The New Journal Typography

SIR—May I through you be allowed to congratulate the Journal Committee Mr Stanley Morrison Mr Eric Gill, and all others concerned in the very great improvement in the *Journal*? In my humble opinion—as a constant reader of it for many years—the results of the thought and care that have been given towards the improvement are in every way admirable

I suppose that the striking red omega surrounding the staff and serpent of Aesculapius is meant to suggest that the *Journal* will still continue to expound the last word in things medical and surgical—I am etc

St Ives Hunts Jan 3 E W GOODALL

SIR—May I send congratulations on the new and greatly improved appearance of the *British Medical Journal* The changes are to the good in every way, and happen to coincide if you will permit me to say so with a particularly readable and well edited issue of the *Journal*—I am etc,

Par Cornwall Jan 2 CHARLES SINGER

SIR,—You have given your subscribers to day a splendid New Year's gift and as one who has struggled for years with a typographical problem (but without achieving signal results) I offer my heartiest congratulations You have set a new standard and have achieved a brilliant result, it is easy to see that the Times New Roman has outstanding merits but it is quite another thing to employ the new type intelligently and effectively With best wishes for your new format—I am etc

London N W 1 Jan 2 JOHN RICKMAN
Editor *British Journal of Medical Psychology*

SIR—May the editor of a much smaller professional weekly journal congratulate you most sincerely on the new format of the *British Medical Journal*? Only those who have actually thought out a revised lay out know the months of work involved and the amount of co operation required from the printers I personally find the new type attractive and as you say it is so much clearer and larger than the old, though the same sized body is used—I am, etc,

St Martin's Street W C 2 Jan 2 HILARY M BLAIR FISH S R N
Editor *The Nursing Times*

SIR—Those of us whose advancing years are plagued with progressive presbyopia will be deeply indebted to the Journal Committee its board of management and the editorial staff for the changes which have been introduced with the New Year The type is admirable and easily legible even in its smallest form The *Times* has accustomed us to the aesthetic appeal of a plain type for headings, without any frills The *British Medical Journal* has done well to follow its example in this respect May I also congratulate you on the external appearance of the *Journal* the colour and lay out of the cover and Mr Eric Gill's device on the front page being especially effective

I have however one criticism to offer which has nothing to do with the new type On page 33 of your issue of January 2 you print a note for contributors for their guidance as to bibliographical references The system is excellent If we ever have the temerity to write an article with references the number of the volume of each publication is to be inserted What are we to do if we refer to the *British Medical Journal*? Is it not a pity that with this new issue and this New Year the *Journal* has not been issued as a new series this being the first issue of volume Number 1—I am, etc.

Cardiff Jan 2 RALPH M F PICKEN

*** We can only find space for a few of the many letters of congratulation which readers are kind enough to send In reply to Professor Picken's question references to the *British Medical Journal* should give the page number and year, and the numeral 1 or 2 to indicate the half yearly volume of that year—ED *B.M.J*

Obstetrics and Gynaecology

Intra-uterine Pessaries Indicted

33 K NORDMEYER (*Dtsch med Wschr*, November 27, 1936, p 1950) reports from the University Maternity Hospital in Gottingen observations on thirteen cases of illness, due to the intra-uterine pessary, in women whose ages ranged from 20 to 46 years The ailments chiefly responsible for bringing these patients to hospital were haemorrhages amounting in some cases to exhausting metrorrhagia, a vaginal discharge, pain in the lower abdomen, a sense of general ill-health, pain in certain cases pain on micturition, peritoneal sensitiveness, and sterility In as many as nine of these cases a more or less extensive operation had to be undertaken, and only in four cases could conservative treatment alone effect improvement or recovery The most frequent sequel to the use of the intra-uterine pessary was an inflammatory reaction, and only in one case did palpation and the histological examination of material obtained by the curette fail to reveal some morbid change In seven cases more or less severe and extensive inflammatory conditions were found—a febrile endometritis alone or in combination with salpingo-oophoritis, parametritis, and pelvic peritonitis The author refers to a discussion in October, 1935, at a meeting of the German Gynaecological Association in Munich, when it was suggested that that association should express in a formal resolution its condemnation of intra-uterine devices for the prevention of conception, as they are injurious to health and dangerous to life Though the author does not state what the fate of this draft resolution was, he notes that whereas the intra-uterine pessary was at first employed with the therapeutic objects of correcting displacements of the uterus, hypoplasia, dysmenorrhoea, etc, it is now employed almost exclusively as a contraceptive and with the illegal object of interrupting pregnancy The author admits that many women may escape from any permanent ill effects of the intra-uterine pessary, but such negative evidence cannot give the lie to the many disasters that can be attributed to the use of this instrument

Treatment of Obstetrical Haemorrhage

34 E LEVY-SOLAL and M SUREAU (*Presse med*, November 4, 1936, p 1721) have made a clinical and therapeutic study of obstetrical haemorrhage, and distinguish two main types large haemorrhages occurring singly or at wide intervals, and frequently repeated attacks of bleeding The degree of shock which ensues modifies to some extent the clinical aspects In the case of a single extensive haemorrhage the cardiovascular tonc can be quickly restored as a rule by the introduction of a volume of fluid roughly equivalent to that of the blood which has been lost When relief is not thus obtained the vasomotor paralysis can often be dealt with by the intramuscular injection of adrenaline In the rare states when this does not avail and there is general shock the authors advise the slow and continuous injection of adrenaline, this will only fail when there is a previous hepato-renal or endocrine insufficiency which has proved incapable of resisting the new strain on the body due to the massive haemorrhage Repeated small haemorrhages are often associated with placenta praevia, the clinical consequences depend on the length of interval between them and the total amount of blood lost Recovery turns on the ability of the body to restore the fluid volume and the corpuscular content, and deficiency in either of these respects demands the appropriate treatment Among the causes of the ensuing shock must be remembered the traumatic factor, the possibility of hypoglycaemia, and the chance of some endocrine disturbance being present The authors describe the appropriate methods to be taken in the various emergencies, mentioning the value of whole-blood transfusion in conditions which tend to repetition of the haemorrhage They insist on the importance of exact blood-matching, frequent verification of compatibility as regards donors lest serum changes should vitiate the nature of the blood, and the control of discovered serum incompatibilities In cases of obstetrical shock strychnine is a particularly valuable adjuvant of adrenaline since it induces an autogenous secretion of the latter as well as causing vaso constriction The usefulness of adrenaline is sometimes negatived by the previous administration of ergotine, hypotension resulting in consequence of inversion of its action In cardiac cases benefit may be obtained from the exhibition of caffeine, digitaline, or ouabain The best anaesthetic for such emergencies is nitrous oxide, for ether may bring about hypotension, while chloroform depresses the cardiac and vascular musculature

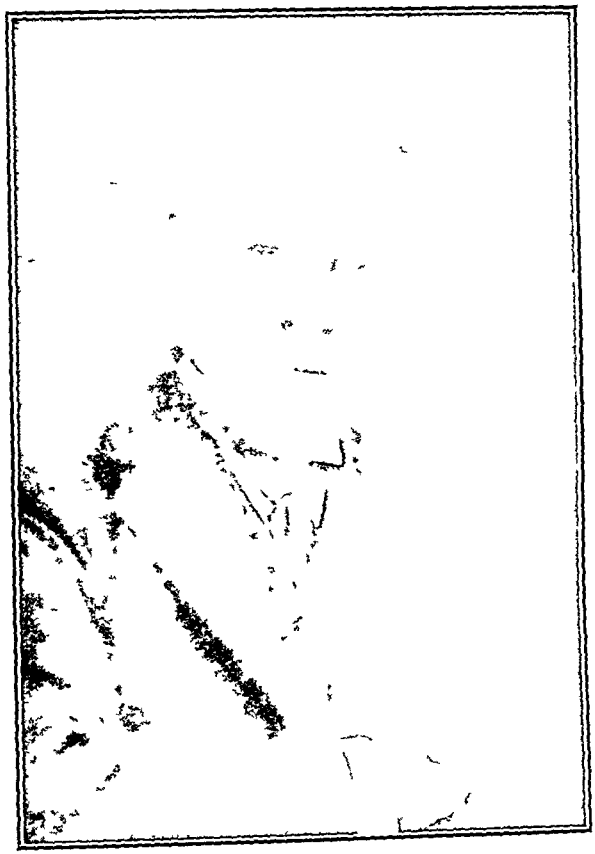
Pathology

Specificity of Cuti-reactions

35 A CORBIA (*Pediatria*, Naples, October 1, 1936, p 869) carried out the Pirquet cuti-reaction with both human and bovine tuberculin on 1,187 children at Sassari, 658 of whom were boys and 529 girls In the boys the reaction were negative with both tuberculins in 70 per cent and positive in 30 per cent, but of the latter in only 82.6 per cent were the tests positive with both tuberculins, while 17.4 per cent were positive with human tuberculin alone (twenty-two) and with bovine tuberculin alone (twelve) Of the 529 girls, 64.8 per cent were negative and 35.2 per cent positive, but of the latter only twenty-nine were positive with both—namely, twenty with human and nine with bovine tuberculin In view of the fact that bovine tuberculosis is practically non-existent in the province of Sassari, Corbia is inclined to believe that the positive results obtained with bovine tuberculin are not connected with bovine infection, but are probably due to special properties of the tuberculin employed

Creatine Studies in Thyroid Disorders

36 G W THORN (*Endocrinology* September, 1936, p 628) applied a modified Richardson-Shorr creatine tolerance to twelve patients with thyrotoxicosis and to seven spontaneous myxoedema In all the untreated cases of thyrotoxicosis there was a mean basal metabolic rate of plus 50 per cent and a decreased creatine tolerance (mean creatine retention of 58 per cent as against 70 to 80 per cent normally), and often the low excretion of creatinine and high creatinuria significantly altered the creatinine coefficient (mg of urinary creatinine per kg of body weight) After iodine therapy the basal metabolic rate fell to a mean value of plus 20 per cent and the creatin retention rose to 70 per cent, with a corresponding fall in the creatinuria, the improvement being probably secondary to the improved metabolic state Four to seven days after subtotal thyroidectomy many patients failed to show further improvement in creatine tolerance although the mean basal metabolic rate fell to plus 5 per cent Later examinations usually revealed improved creatine tolerance and absence of creatinuria Injections of thyrotropic adrenal, cortical, and anterior pituitary growth hormones failed to affect the creatinuria and creatine tolerance in thyrotoxic patients The seven myxoedematous patients had no demonstrable creatinuria, and their creatine tolerance varied from 86 to 95 per cent retention All developed creatinuria within forty-eight hours of the institution of thyroid medication, reaching maximum values in approximately seven days The onset of creatinuria preceded the rise in the basal metabolic rate the loss in weight, and the signs of clinical improvement and the degree of creatinuria were related to the thyroid dosage The author suggests that the appearance of creatine in the urine might be used in assays as an index of the activity of thyroid preparations The degree of creatinuria is useful in determining the dosage of thyroid in myxoedema and in totally thyroidectomized patients



Obituary

SIR GRAFTON ELLIOT SMITH M.D., F.R.S.

LITT.D., D.Sc., F.R.C.P.

Emeritus Professor of Anatomy, University College, London

Grafton Elliot Smith, born at Grafton, New South Wales, on August 15, 1871, was the son of the local schoolmaster, a Colonial of English and Welsh stock. In 1888 young Elliot Smith entered the newly founded medical school in the University of Sydney, where he was fortunate in attracting the attention of Anderson Stuart, the professor of physiology, and J. T. Wilson, the professor of anatomy, two zealous missionaries from the Edinburgh school. Sir Anderson Stuart became the doyen of Australian medical circles, and J. T. Wilson is now emeritus professor of anatomy at Cambridge. After graduating as M.B., Ch.M. in 1892, Elliot Smith held various hospital house appointments, and in 1894, when appointed demonstrator in anatomy, began his active career as anatomical teacher and investigator. His facility, intuitive genius, and flair for the obvious may be seen in the four papers published in 1894. They dealt with a hydatid cyst in a congenital hernia, the significance of certain rare nerve, muscle, and vascular anomalies, and the cerebral commissures of the mammalia with special reference to the monotremes and marsupials.

Elliot Smith was now definitely devoted to anatomical research, and in 1895 he published in addition to his thesis for the doctorate on the anatomy and histology of the cerebrum of non-placental mammals eleven papers dealing with the morphology of the brain. Thus at 24 years of age he established a European reputation which was based on his clear and lucid presentation by text and illustration of the evolution of the cerebrum and cerebellum and of the part played by olfaction. His early associates in Sydney were Sir Almroth Wright, Sir Charles Martin, and Professor J. P. Hill. A goodly company!

In 1896 Elliot Smith obtained the first travelling Fellowship from Sydney University, and came to the British Isles to seek bench space for his research. It says much for Alexander Macalister, then professor of anatomy at Cambridge, that he welcomed Elliot Smith as a research student. Elliot Smith in later years spoke with feeling of the lack of facilities for post-graduate workers in the Old Country. Oxford University would not accept him without the traditional test in Latin and Greek. Fortunately he found the sister institution at Cambridge more easily satisfied. Almroth Wright and Donald MacAlister were then in Cambridge and piloted him through the maze of university and college ritual, so that he was admitted to St. John's College.

During the Cambridge phase Elliot Smith began to revolutionize neurology. He pestered Professor Macalister for a microtome and eventually drove him to such desperation that he thrust his hand into his pocket and threw a handful of sovereigns, recently collected as students' fees, upon the bench. Elliot Smith bought a Cambridge rocker and startled the topographical anatomists by cutting brain sections in the physiology department. At this time the anatomy department housed Macalister, Alexander Hill, Duckworth, and Barclay Smith; the physiology department Hugh Anderson, Gaskell, W. B. Hardy, Langley, and zoology Bateson, Heape, and Brindley; while Sherrington in Liverpool, Mott, Sharpey-Schafer, Horsley, and R. H. Clarke at University College, London, were intensively engaged on the physiology of the nervous system. Elliot Smith pursued his own line of research and from 1897 to 1900, besides publishing eight papers dealing with cerebral morphology, he undertook the preparation of the descriptive catalogue of the brain collection in the Royal College of Surgeons, a work destined to be a monument to his original powers of observation and a source-book for a generation of research workers in anatomy and physiology. His salary as demonstrator of anatomy was £50 a year. In 1899 St. John's College recognized his researches in cerebral morphology by electing him to a Fellowship within three years of his admission to the college.

In 1900 Elliot Smith left Cambridge to become the first occupant of the chair of anatomy in the new Government Medical School at Cairo. The acceptance of this post profoundly influenced his future work and interests. Many would wish that he had continued to work in Cambridge and had confined himself to his fruitful researches in neurology instead of becoming involved in additional spheres of interest. However, Elliot Smith in addition to a missionary zeal was endowed with that type of scientific inquiry and judgement which, to quote Montaigne, is "a tool adapted to all subjects and meddles with everything." During the nine years he spent in Egypt he founded an active department of anatomy, continued his neurological and anatomical researches, and

We are indebted to Sir ARTHUR KEITH for the following appreciation

In the last fifty years the outlook and methods of British anatomists have been transformed in this transformation—or reformation—Elliot Smith has had a greater share than any other man Nearly all the younger anatomists who have made a mark or who are now gaining distinction are directly or indirectly influenced by his teaching and example He could use scalpel, forceps, and pen as well as any of the older anatomists but to these more primitive instruments of research he added the technical methods which were being developed in microscopical laboratories during his youth He modelled himself on Huxley rather than on Turner

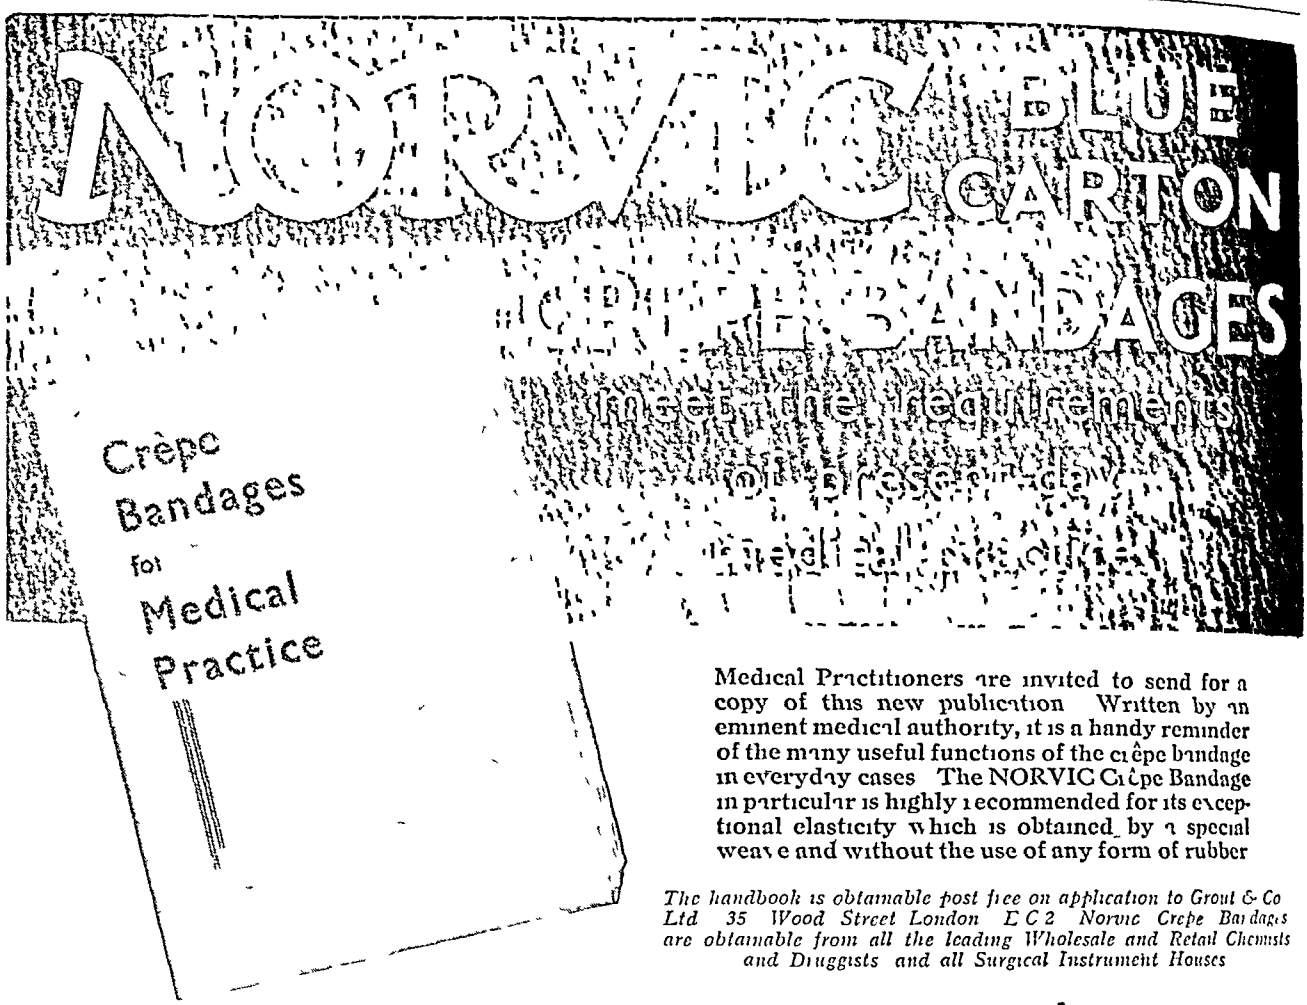
His career has many elements of romance in it It exemplifies one of the many bonds which are helping to give unity to the peoples which form the British Commonwealth It is often said that our King is our only bond, but this is not so there are many others Elliot Smith was born and bred in New South Wales when his State began to build a university in Sydney it picked its professoriate from the home country J T Wilson, who became Macalister's successor in Cambridge went out from Edinburgh to fill the chair of anatomy Under his influence there grew up a succession of young anatomists in Sydney—the most brilliant being Elliot Smith Another was the Sydney John Hunter

Cambridge made the next step in his career possible Fully forty years ago statesmanlike minds of that ancient seat of learning took a step which made their university truly imperial by providing opportunities which made it possible for any budding geniuses of the Dominions to seek development in their laboratories Rutherford was one and Elliot Smith was another of the young men who seized the opportunity thus offered and there were many more

Cambridge supplied a laboratory bench but the subject of investigation and the methods employed he brought home with him No one watching him then unravelling the finer anatomy of the marsupial brain could believe that he was on the right road to throw a flood of light on the structure of the human brain But it was so He had grasped as so few had then done, that evolution was a truth and that the mammalian brain was a real unity, framed and fashioned on the same pattern from lowest to highest, and the lowest and simplest gave clues to the highest and most complex He perceived that the mammalian brain had originally been a small brain This clue he followed with a success which is known to all anatomists

The museum of the Royal College of Surgeons of England provided the material for his next advance It had an unrivalled collection of brains of Primates besides many other classical specimens which had been prepared and studied by that prince of anatomists Richard Owen At the suggestion of Professor Charles Stewart then conservator of the museum, the Council of the College invited Elliot Smith to prepare a catalogue of the brain series The result was a descriptive catalogue which became a classic and is still the best textbook on the mammalian, and especially the Primate, brain

Imperial connexions provided him with his next opportunity—Egypt Soon after his arrival in that country Reisener was exposing the contents of cemeteries which were to be submerged under the water of the Nile above Aswan Hundreds of skeletons of people representing the population of the valley at all stages of its history were being exposed He went there in vacations and was joined by Wood Jones now of Melbourne, and they threw themselves into their work of examination and recording with zest A side issue was a close observation of the evidence of disease and injury The unique collection of pathological specimens illustrating the diseases and injuries of the ancient Egyptians, now in the museum of the College of Surgeons is one of the fruits of the toil of these two anatomists Elliot Smith's interests were too wide to be confined within the limits of strict anatomy He became interested in the civilization of Egypt as recorded in her ancient graves He was gradually led to formulate the theory that Egypt was the cradle of human civilization



Then came Manchester There he built up a double school—one of neurology the other of human culture—championing the theory that civilization has spread always from a centre And he fought with a bludgeon—for he was Huxleyian in his methods of warfare Then came the last stage—University College London and the building up of an anatomical institute on modern lines Here he developed his two former loves—brain and culture—and added a third—the history of mankind as evidenced by human fossil remains No one ever accomplished so much with so little evidence of hurry or of effort His body and his brain are now dead but his influence and his example will live in our British school of anatomy for many a century to come

J T DUNSTON M D

Late Commissioner for Mental Hygiene Union of South Africa

News has reached this country of the death at Bellair near Durban of Dr John Thomas Dunston for many years medical superintendent of the Pretoria Mental Hospital and commissioner for mental hygiene to the Union of South Africa He was born in Lincolnshire in 1870 and studied medicine at Guy's Hospital where he won an entrance scholarship in science obtaining the English conjoint diplomas in 1899 the M B and B S degrees of London University in 1900 and the M D in 1901 After three years as house surgeon and in special appointments Dr Dunston entered the London County Council Mental Hospital Service In 1905 he sailed for South Africa on appointment as senior assistant physician to the Pretoria Mental Hospital becoming physician superintendent in 1907 In 1914 he was made inspector of mental hospitals under the South African Government and two years later commissioner for mental hygiene His period of duty as commissioner was a most important one in the history of the treatment of mental diseases in the Union

Notwithstanding the many claims upon his time and energy Dr Dunston held various other appointments many of them honorary He was the first professor of psychological medicine in the Witwatersrand University neurologist to the Pretoria Hospital consulting psychiatrist to the Transvaal Education Department and neurologist and psychiatrist to the Transvaal railways he was also for many years consulting psychiatrist to the Union Department of Education and medical inspector of leper institutions The main clauses of the Mental Diseases Act of 1916 had been drafted under his guidance and in all problems of preventive treatment of mental and psychological aberrations he was recognized as a broad minded advocate of the modern point of view The strong attitude he took before the Union Education Commission in 1923 and his advocacy of special classes and special treatment for retarded children are bearing fruit in South African educational policy A man of singularly modest disposition Dr Dunston never sought publicity He joined the British Medical Association in 1911 and

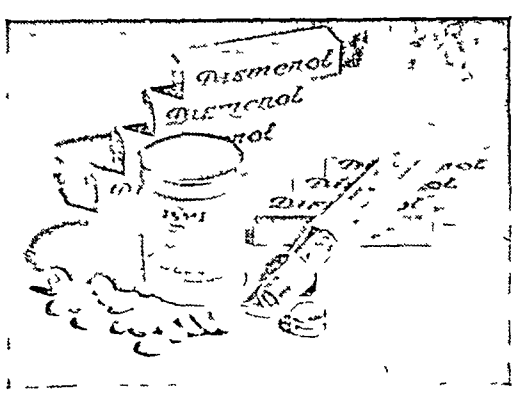
Medical Practitioners are invited to send for a copy of this new publication Written by an eminent medical authority, it is a handy reminder of the many useful functions of the crêpe bandage in everyday cases The NORVIC Crêpe Bandage in particular is highly recommended for its exceptional elasticity which is obtained by a special weave and without the use of any form of rubber

The handbook is obtainable post free on application to Grout & Co Ltd 35 Wood Street London E C 2 Norvic Crepe Bandages are obtainable from all the leading Wholesale and Retail Chemists and Druggists and all Surgical Instrument Houses

KASENA

THE VEGETABLE LAXATIVE

KASENA is a very pleasant and non-griping aperient prepared by a special process from matured Cascara Bark and selected Senna Leaves Both are well known and very reliable aperients and Kasena offers the Physician a trustworthy means of prescribing them when their use is indicated



KASENA retains the full activity of its constituents and is specially suitable for elderly and delicate persons and for children

It is invaluable in habitual constipation

KASENA is supplied in bottles at 1/9 3/- and 5/6 Postage 6d extra

For many years I rarely missed his Saturday operating afternoon at "Middlesex" he came at 2 o'clock and left precisely at 4, having completed his regular quota of four 'coeliotomies' for conditions as varied as a pathological spleen, a hydatid cyst, a cervical fibroid or a cancerous colon. He would have been the first to insist how much the afternoon's work had been expedited by the co-operation of his anaesthetists, formerly the late H. Percy Noble and in the last fifteen years of his time at Middlesex by his loyal and devoted friend Raymond Apperly. None of his old house surgeons, dressers or the spectators will ever forget his resource, his tricks of technique by which he facilitated the delivery and removal of formidable pelvic tumours, his sang-froid and self-reliance in unexpected crises, his urbanity, and his unfailing courtesy whatever the emergency that might well have alarmed. If celerity at times led to error none could have been more rapid to detect mistake or more speedy to make a quick decision and to rectify. It required courage to open a bleeding extra-uterine pregnancy without anaesthesia in a bed in a private house to withdraw the gravid tube and to clamp it, while preparations were then made to deal more deliberately with the condition, and his success in removing the spleen in severe cases of pernicious anaemia long before the days of blood transfusion and of our present knowledge of medical therapy for this disease made his colleague Dr. Essex Wynter regard surgery as the appropriate treatment for this malady.

Although his warmest admirers cannot be blind to his technical imperfections in the surgery of the upper abdomen when judged by modern standards it must nevertheless be remembered that he was the second British surgeon to perform a successful choledochotomy, and nearly a quarter of a century ago he was practising gastro-duodenal resection for non-obstructive duodenal ulcer. Neither the 'cranial box' nor the 'thoracic cage' attracted him, although he did develop an interest in the surgery of the heart, his interests were centred in the abdominal valise, and he was at his very best in its lower region.

His genius for friendship and for hospitality has been already referred to but his kindliness and generosity to the very junior may perhaps not be so well known, for in many instances his right hand knew not what his left hand was doing.

DR GEORGE HENRY BURFORD who died on January 3 after a brief illness was born at Didsbury in 1856. He had a distinguished student career at the University of Aberdeen obtained the degrees of M.B. and C.M. in 1881 and continued his studies in London, Vienna and Berlin. Soon after graduation and while holding resident posts in Manchester and elsewhere he began to take a deep interest in homoeopathy, and in 1890 was appointed physician for diseases of women to the London Homoeopathic Hospital having been elected a Fellow of the old British Gynaecological Society two years earlier. He joined the British Medical Association in 1883. Dr. Burford served as president of the British Homoeopathic Society in 1901 and of the British Homoeopathic Congress in 1904; he also presided over the International Homoeopathic Congresses of 1911 and 1927. He had practised in Queen Anne Street for more than forty years and last month a testimonial in celebration of his long and prominent connexion with homoeopathy was organized by a number of professional colleagues and other friends the presentation being made on his eightieth birthday by Sir George Wyatt Truscott, formerly Lord Mayor of London. Dr. Burford leaves a widow and three sons of whom the eldest is Dr. Harold George Burford.

Medical News

We publish this week in our advertisement columns notices from the University of Oxford inviting applications for the Nuffield Professorships of Clinical Medicine and Obstetrics and Gynaecology. Applications must reach the registrar of the University by April 17. The salary in each case is £2,000 per annum.

A sessional meeting of the Royal Sanitary Institute will be held at the Castle, Shrewsbury, on January 22 at 4.20 p.m. and on January 23 at 10 a.m. in conjunction with the Midland Centre of the Sanitary Inspectors' Association. There will be discussions on Shrewsbury's New Water Supply Scheme, on School Heating, on Administrative Units of Local Government, and on The Housing Act, 1935: Practical Administration.

Mr. Philip Franklin will lecture before the Vienna Phonetic Society on January 21 on the evolution of speech in the deaf-mute baby—the method used in the research clinic for deaf mutes at the Infants' Hospital, Vincent Square, Westminster.

The tenth congress of the Far Eastern Association of Tropical Medicine will be held in Hanoi in March, 1938, and not 1937 as previously announced.

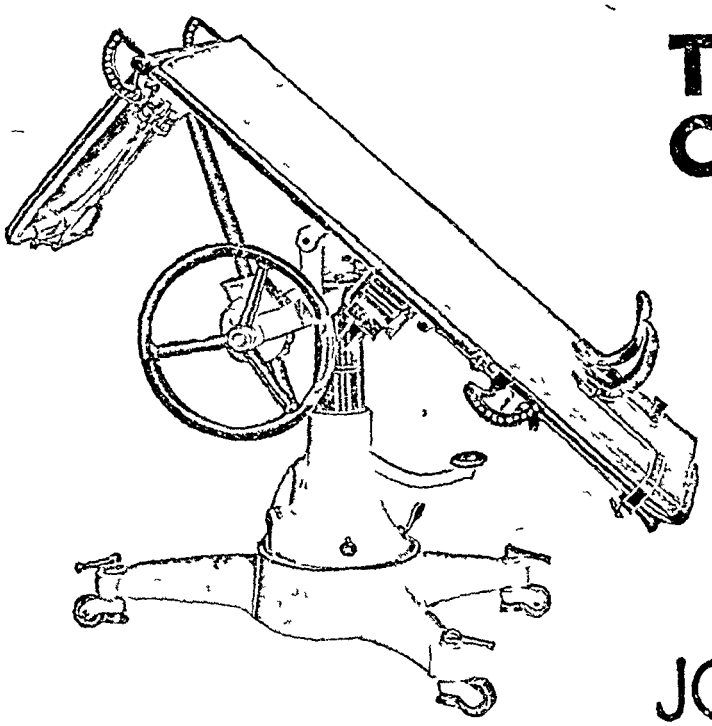
The first issue of the *Practitioner* for 1937 appears in a revised format and is printed in a different type; changes which will be readily appreciated by the reader. A special symposium on gynaecology in the January number includes articles by Mr. Victor Bonney, Professor F. J. Browne, Mr. Wilfred Shaw, Professor Amy Fleming, Professor O. Donel Browne, and Mr. V. B. Green-Armytage.

Dr. Thomas Bell, J.P., of Loughborough has received a presentation of a silver salver, etc., from patients and friends on his retirement after thirty-four years' practice at Shepshed.

On December 15, 1932, the Minister of Health issued a memorandum on acute poliomyelitis. This has been revised in the light of present-day knowledge and in its amended form (Memo. 166/Med.) is obtainable through any bookseller from H.M. Stationery Office, price 2d.

The Medical Society of Vienna will celebrate the centenary of its foundation in conjunction with the Union for Post-Graduate Instruction from May 19 to 29. A full programme will shortly be published.

A committee has been formed at Vienna to celebrate the centenary of the birth of Professor Leopold Schrotter Ritter von Kristelli on February 5, 1837, a pioneer in laryngology and rhinology and the sanatorium treatment of tuberculosis, who died on April 22, 1908.



Dr. Fritz de Beule, professor of clinical surgery at Ghent University, has been elected president of the Royal Academy of Medicine of Belgium for 1937.

The editorial committee of the ninth International Congress of Dermatology and Syphiligraphy, held at Budapest in 1935, gives notice that publication of the proceedings will require more time than was at first supposed and will probably not occur until August.

Dr. Luigi Costa, who recently died at Buenos Aires, has left 300,000 pesos for the erection of two wards in the Institute of Experimental Medicine directed by Professor Roffo, for the study and treatment of cancer.

The incidence of syphilis in the French home army has risen from 4.79 per 1,000 in 1924 to 8.71 per 1,000 in 1933, the last year for which statistics are available. This rise is traced in large part to the quartering of native troops in France.

Infantile paralysis has recently been made a notifiable disease in Switzerland.

DUNLOPILLO MATTRESSES

IDEAL FOR THE MODERN HOSPITAL

The trial period of the Dunlopillo Mattress is past It is now established as an important contribution to the welfare and comfort of patients and the efficient working of the staff in hospitals and nursing homes everywhere

The reasons for its popularity are —

SMOOTH UNIFORM SURFACE with no buttons which supports with perfect uniformity

SELF VENTILATING because it is completely porous

PREVENTS BED SORES owing to smooth surface and automatic ventilation

GERM, MOTH and VERMIN-PROOF. Therefore needs no sterilization

LABOUR SAVING. Does not require turning shaking or re making

RELIEF in CASES of RHEUMATISM because the body can relax to the maximum

ASTHMA and HAY FEVER are alleviated because there are no hair feathers or down in its constr and nothing to create dust

Medicine

18 Diagnosis of Early Arteriosclerosis

O WEILL and R LE CLUYSE (*Brux med* November 8, 1936 p 36) discuss the symptomatology of early arteriosclerosis and review the various diagnostic procedures By applying the quadruple Pachon test in which the wave rate along the arteries in the upper and lower limbs is plotted graphically, they claim to have shown that in early atheroma there is a difference between the graphs of the upper and lower limbs, and that this variation is intensified as the disease progresses Sometimes the four curves differ, at other times those of the lower limbs are alike but unlike those of the arms These divergencies in character and degree differ also from the changes associated with conditions of hypertension and hypotension induced in normal vessels and appear to be indicative of fibrotic stenosis they can be recognized before the usual clinical symptoms are manifest Their presence excludes such conditions as rheumatism nephritis, and sciatica and enables suitable treatment to be begun without delay The authors believe that arteriosclerosis often attacks the whole of the arterial system but involves usually first and most seriously the arteries of the lower limbs it may, however, be limited to only one part of the body such as the kidneys or the coronary system They describe this disease as amounting to a diminution or suppression of the action of the peripheral heart which is normally very much concerned with the circulation throughout the body generally when this occurs extra strain is thrown on the cardiac musculature, and the characteristic changes follow in due course Early diagnosis permits steps to be taken to relieve the heart before it becomes permanently damaged

19 Anaemia in Pulmonary Tuberculosis

H RASMUSSEN (*Norsk Mag Laegevidensk* November, 1936 p 1125) has measured the haemoglobin of 500 patients admitted to the Glittre Sanatorium in Norway since the summer of 1935 In forty of these cases diseases other than tuberculosis were diagnosed In fifty-seven of the 460 tuberculous cases (12 per cent) anaemia was demonstrable The anaemic cases were classified in three groups In the first containing thirty four cases, the anaemia disappeared under treatment with iron The general condition of most of these patients was satisfactory and uncomplicated by fever In the second group of thirteen cases the anaemia was evidently connected with the tuberculosis which had spread to other organs such as the intestines The general condition of these patients was poor, and most of them were more or less febrile In the third group, containing ten cases, the anaemia could be traced to some complicating factor such as infection with haemolytic streptococci or could not be traced to any one cause While the frequency of anaemia in the material as a whole was 12 per cent it was 15 per cent of the 343 sputum positive cases Among the patients without anaemia were several whose pulmonary tuberculosis was extensive and rapidly progressive In this category were many patients whose white skins contrasted with the redness of their mucous membranes The pulmonary disease showed no special features in the fifty seven anaemic patients to distinguish them from the 403 who were not anaemic Indeed the ratio of benign to rapidly progressive forms of the disease was approximately the same in the two groups It was also found that even though the anaemia yielded to iron, the disease in the lungs might continue to progress and that such progress did not influence the percentage of the haemoglobin It would thus seem that tuberculosis of the lungs has little or no influence on the haemoglobin content of the blood As in most cases of anaemia associated with pulmonary tuberculosis the response to iron cures the former systematic haemoglobin estimations would seem desirable in cases of pulmonary tuberculosis in order that the anaemia at any rate may be cured by iron The defective hydrochloric acid secretion in the gastric juice of twelve of the author's anaemic patients may in his opinion give a useful clue to the origin of their anaemia

20 Mucous Colitis

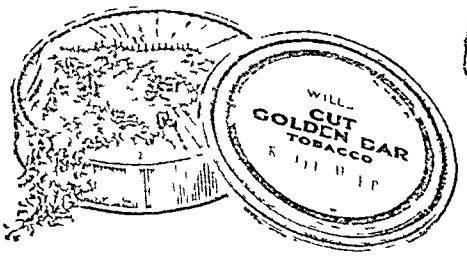
J R GOODALL (*J Obstet Gynaec Brit Emp* October 1936, p 925) studying 200 cases finds mucous colitis often undiagnosed because the symptoms are referred The symptoms of colitis are pain in any part of the abdomen fixed or variable most often in the sigmoid Constipation past or present is always noted Faeces may be hard or soft, with glairy mucus even blood stained giving burning pain on evacuation Evidence of incomplete clearing of the upper bowel is commoner than that of hypermotility either of which causes pain Evacuation of the bladder relieves abdominal pain during the night Palpation may be negative or locate a hard and tender portion of bowel If at the caecum appendicitis may be present also Severe cases have abdominal cramp with bouts of painful diarrhoea Referred symptoms may be cerebral ocular especially vertigo cardiac precordial pain and pseudo anginal symptoms pelvic always associated with dysuria and causing dysmenorrhoea, leucorrhoea or most often, suggesting tubo ovarian disease even to associated infective thickening of the left broad ligament gastric Proctitis and chronic arthritis may occur Treatment excludes all meat from the diet also condiments and roughage gives milk vegetables eggs plenty of water mineral oils bile salts to remove causes of putrefaction, and luminal to lower autonomic sensitivity Kondremul with sodium luminal 1/8 grain three times a day is advised For chronic cases a course of high colon lavage with normal saline and prolonged care in diet Differential diagnosis depends on a history of previous attacks of colitis possibly unrecognized In the absence of diarrhoeic bouts the intestinal origin of cardiac and cerebral symptoms is easily missed Combinations of causes including psychic factors, are common, hence the frequency of relapse

Surgery

21 Infarcts of the Kidney

R DESJACQUES and A BOUHEAU (*Lyon chir* November-December 1936 p 645) in a study of the pathology and symptomatology of infarcts of the kidney *point out that* this condition is rarely diagnosed during *the lifetime of* the patient The infarct may be partial *when it is tri*angular in shape with the base towards *the cortex* and the apex towards the hilum or massive *when the infarct* produces the complete obliteration of a large vessel of the kidney In the latter case *the* kidney becomes enlarged at first but gradual atrophy takes place following cicatrization of the infarct Embolism thrombosis and spasm are *the three principal* causative factors cardio aortic lesions being responsible for 63 per cent of cases of vascular occlusion The principal subjective symptom of renal infarct is pain which occurs in nearly all cases The onset is sudden and without apparent cause and the pain is sometimes so severe as to be unrelieved by morphine The objective symptoms include diminished *diuresis* while complete anuria may result from large infarcts of both kidneys Albuminuria is a common symptom *and haematuria* is often present Alimentary or biliary vomiting often occurs The prognosis depends on the size of the lesion death being frequent in cases

GOLDEN MOMENTS



England v Wales

He's got to be good to get into his country's team —but what a Golden Moment it must be for him when he scores between the posts to give his side the victory

But even the International, good as he is, can't smoke a better tobacco than "Cut Golden Bar" at a shilling an ounce But it *must* be Wills's

MAW STEROTHERM

HOT AIR ELECTRIC AUTOMATIC STERILISER

Patent No 427581

A new and thoroughly efficient Electric Apparatus for sterilizing Instruments, Dressings, etc, by means of hot air

SPECIAL FEATURES

- Automatic regulation of temperature
- No supervision necessary while in use
- Very small current consumption
- Articles in apparatus remain sterile until required, as closure is bacteria proof
- Dressings quite dry after leaving Sterilizer
- Convenient size—length 16½ inches, diameter 9½ inches

PRICE £20

Full details will be sent upon request
Complete demonstration by appointment

S. MAW, SON AND SONS, LTD.

7-12, ALDERSGATE STREET, LONDON, E C.1

20 grammes 80 per cent alcohol to 100 grammes of water) In the morning the face may be washed with warm water containing a soluble sulphide, sulphur dioxide, *or sulphurine* Fatty creams and soap are forbidden a talc powder is allowed Adjuvant measures are treatment of dyspepsia, of constipation (preferably by sulphur or suppositories) and of menstrual abnormalities by ovarian and possibly hypophyseal preparations

27 Epidermolysis Bullosa

E v JACHMANN (*Derm Wschr* December 5, 1936, p 1603) with Siemens and others, distinguishes between two forms of this hereditary malady (1) a simple form transmitted in most cases as a Mendelian dominant, (2) a severe or dystrophic form leading to trophic lesions of hands loss of nails, and much scarring and sometimes transmitted as a recessive In a case of simple epidermolysis bullosa here described in a boy aged 14 the history was deceptive as the possibility of including the dystrophic form of the disease among those for which sterilization is compulsory in Germany is under consideration, parental co operation was perhaps not to be expected A light dermatosis was excluded by experimental test and the absence of haematoporphyrinuria Considerable improvement followed intravenous injections of antileprol, a treatment which v Jachmann had found effective in a previous case

28 Cutaneous Tuberculosis

H TH SCHREUS and A PROPPE (*Derm Wschr* November 28 1936 p 1573) in a very detailed analysis of 1,111 cases of cutaneous tubercle find that the affection is predominant among the young and that more than one half of the patients were below the age of 20 The general condition of nutrition has a definite influence on the incidence of the affection The largest numbers of cases were recorded during the war years and the immediate post war period Many different methods of treatment were used such as curetting gold injections diet artificial and natural sunlight, tuberculin and x rays These different treatments were successful in about 30 to 40 per cent of cases Dietetic treatment proved disappointing and a number of patients treated unsuccessfully by diet were subsequently cured by local treatment

29 Osler's Disease

H GOTTRON (*Med Klinik* December 4, 1936 p 1660) believes that Osler's disease is not as uncommon as is generally held The characteristic lesions are purple discrete sharply defined telangiectases varying in numbers from twelve to a hundred, and occurring on the skin and mucous membranes The face and upper extremities are most commonly affected the trunk less commonly On the face the cheeks naso labial folds, forehead chin and ears are the sites of preference On the hands the palmar and dorsal surfaces of the hand and fingers and especially the distal phalanges are affected Telangiectases are found chiefly on the mucous membranes of the mouth and nose but may be seen in the stomach bowels and bladder On the skin the lesions protrude slightly from the surface, and are not angiomata but true telangiectases They occur irregularly on both sides of the body and vary in size from a pin head to a pea They disappear on pressure with a watch glass and reappear immediately the pressure is removed Patients with Osler's disease have a marked tendency to bleed from mucous membranes and skin areas surrounding the telangiectases Incised and lacerated wounds do not bleed more profusely than in other conditions Haemorrhage may be followed by secondary anaemia and eventually be fatal Epistaxis characterizing the 'haemophilic stage usually commences in the second decade and may remain the only symptom for ten years or longer Telangiectases occur generally in the third decade rarely sooner, and haemorrhages tend to become less frequent Hormonal toxic and seasonal influences play a part in the production of the characteristic lesions Osler's disease is a hereditary condition and a dominant The sexes are equally affected and both sexes transmit it Certain families produce definite bleeding types—for example epistaxis haemorrhage into joints, and telangiectases occurring alone There is no treatment for the lesions Anaemia must be treated with blood transfusions Liver extract was found beneficial in one case

30 Infectious Impetigo

T ASAI (*Jap J Derm Urol* September 20, 1936 p 112) has investigated 323 cases of infectious impetigo in the course of eleven years The favourite places of localization of the disease were the face and less often the trunk of the body The extremities were affected comparatively rarely Of the 323 cases 110 typical cases were chosen for bacteriological investigation and pure cultures of *Staphylococcus aureus* and *Staphylococcus albus* were obtained the *Staphylococcus aureus* predominating It was found in 77 3 per cent in the Japanese and in 87 3 per cent among the Formosan Chinese These proportions varied somewhat from year to year The *Staphylococcus aureus* and *Staphylococcus albus* obtained by the author, although they showed some slight differences of agglutination and of resistance to heat possessed all the characters of the pathogenic staphylococcus The pigment of the *Staphylococcus aureus* in the author's series was found identical with the pigment of the coccus obtained from other suppurations With regard to treatment the author advises albargin (0 1 to 0 15 per cent), protargol (0 25 per cent) and bichloride of mercury (0 05 per cent) for both bathing and cleaning

31 Conjugal Poradenitis Venerea

S KOYAMA (*Jap J Derm Urol* October 20 1936 p 149) confirms the report of other clinics that poradenitis venerea (lymphogranuloma inguinale) is comparatively infrequent among women and is rarely seen in a conjugal incidence Among 170 cases he has found nine only of conjugal infection including one with no bubo but with rectal ulceration and one with neither of these but with a positive Frei reaction In the seven with inguinal bubo the primary lesion was on the external genitalia and one of these had ulceration of the portio Her vaginal secretion exhibited antigenic properties identical with those of the bubonic pus used in the Frei test Routine examination of the spouse is advised when males apply for treatment for poradenitis venerea

32 Koilonychia

According to A I KARTAMISCHEW (*Derm Wschr* September 12 1936 p 1257) koilonychia (hollow or spoon shaped nails) was described in 1874 originally the second third and fourth fingers of the right hand were said to be preferentially affected and the toe nails to be almost always exempt Flat nails (platonychia) may be a preceding condition In many instances koilonychia is a familial peculiarity affecting several generations Eczema of the nails is said to be occasionally a predisposing cause and there are numerous examples (including three cases here described) of koilonychia *due to occupational irritation*—for example in milkmaids chemists o chemical workers and domestic servants Exposure to cold and nail biting are said to be occasional causes of koilonychia which in the author's experience is equally common among males and females children and adults Treatment apart from removal of causes of irritation and attention to general health is symptomatic Kartamischew, writing from Tashkent in Central Asia makes no mention of hypochromic anaemia of middle aged women as a cause of koilonychia but alludes to several authors who have reported this condition in chlorosis

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER C.M.G., A.D.C.

Medical Superintendent DANIEL F RAMBAUT M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra-violet Apparatus and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North West side of the Estate, a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton), who can be seen in London by appointment.

HAYDOCK LODGE,

NEWTON-LE-WILLOWS, LANCASHIRE,

Teleg. Street, Ashton-in-Makerfield. *'Phone* Ashton-in-Makerfield 7311.

For the reception and treatment of PRIVATE PATIENTS of both sexes of the UPPER AND MIDDLE CLASSES suffering from mental and nervous diseases, either voluntarily, temporarily, or under Certificate. Patients are classified in separate buildings according to their mental condition.

Situated in park and grounds of 400 acres. Self-supported by its own farm and gardens in which patients are encouraged to occupy themselves. Every facility for indoor and outdoor recreation. For terms, prospectus, etc., apply MEDICAL SUPERINTENDENT.

COURT HALL, KENTON, near EXETER,

URBAN DISTRICT COUNCIL OF ENFIELD

DEPUTY MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER (Male)

The Urban District Council of Enfield invite applications for the appointment of a Male Deputy Medical Officer of Health and Assistant School Medical Officer.

The commencing salary will be £600 per annum rising by annual increment of £25 to a maximum of £750 per annum subject to a deduction of £5 per cent. in pursuance of the Local Government and Other Officers Superannuation Act, 1922. An allowance of £40 per annum will also be paid for the provision and maintenance of a motor car.

Candidates must be registered Medical Practitioners under 40 years of age of at least three years standing and should have had experience in the work of Maternity and Child Welfare and School Medical Inspection.

Applicant must also possess the Diploma in Public Health.

The person appointed will be required to reside in the district and to devote the whole of his time to the duties of the office will not be allowed to engage in private or consulting practice and will work under the supervision of the Medical Officer of Health who is also the School Medical Officer.

The appointment will be determinable by one month's notice from either side and one of the terms hereof will be that it will be subject to the regulations made from time to time by the Council in regard to holidays and the payment of salary during periods of sickness.

The person appointed will be required to pass a medical examination.

Candidates must disclose in writing whether to their knowledge they are related to any officer or employee of the Council and a candidate who fails so to do will be disqualified for the appointment and if appointed will be liable to dismissal without notice.

Applications accompanied by copies of not more than three recent testimonials must reach the undersigned not later than noon on Monday, February 1st, in envelope endorsed "Deputy M.O.H. and Assistant S.M.O."

Canvassing member of the Council directly or indirectly will disqualify candidate for the appointment.

Forms of application will be supplied by the undersigned upon the receipt of a stamped addressed foolscap envelope.

Public Offices, S. J. DAPPS
Enfield, Middlesex. Clerk of the Council.
December 30th, 1936.

BEDDINGTON AND WALLINGTON URBAN DISTRICT COUNCIL

APPOINTMENT OF MEDICAL OFFICER OF HEALTH

The Council invite [illegible] for the appointment of Medical Officer of Health of the Urban District of [illegible].

The commencing salary will be £800 per annum, travelling (car) allowance of £50 per annum.

Each applicant must be a duly qualified Medical Practitioner and registered in the *Medical Register* as the holder of a Diploma in Sanitary Science, Public Health or State Medicine, and the successful candidate will be required from engaging in private practice as a Medical Practitioner.

The appointment will be made subject (1) to the approval of the Minister of Health, (2) to the terms of the Local Government Act, 1933, and of the Sanitary Officers (Outside London) Regulations, 1935, (3) to the provisions of the Local Government and Other Officers' Superannuation Act, 1922, and (4) to a satisfactory medical examination.

The person appointed will be required to perform the duties imposed on a Medical Officer of Health by all the relative Acts and Orders and to undertake the administration of the Maternity, Child Welfare and Ante-natal Services of the Council and such other duties (if any) as may be assigned to him from time to time by the Council.

The Medical Officer will be required to reside within the Urban District.

The Council have petitioned for the grant of a Charter of Incorporation.

Applications stating age, qualifications and particulars of experience, etc., and accompanied by copies of not more than three recent testimonials, must be delivered to the undersigned by the 23rd instant.

Canvassing will disqualify.

Town Hall, T. BOOTH
Walling[illegible], Surrey. Clerk of the Council.
January 1st, 1937.

FRENCH HOSPITAL AND DISPENSARY

172 Shaftesbury Avenue, W.C.2

[illegible] or the post of [illegible] with charge of [illegible] holding Fellowship (Membership) of the French Hospital and Dispensary in their application to the Secretary on or before Jan. 23rd.

METROPOLITAN BOROUGH OF STOKE NEWINGTON

ASSISTANT MEDICAL OFFICER OF HEALTH (Woman)

The Council invite applications from fully qualified Medical Women for the appointment of a Whole-time Assistant Medical Officer of Health.

Applicants must be under 40 years of age and possess the Diploma in Public Health. The following experience is essential full details of which must be given in the application form:—

1. Special experience in the management and dietetics of infancy.
2. A post-graduate appointment in a Hospital devoted to the treatment of children disease.
3. Special experience in ante-natal care and management of pregnancy.

Practical experience in artificial light therapy, Schick testing and immunization against diphtheria will be regarded as valuable additional qualification.

The officer appointed will work under the direction and control of the Medical Officer of Health and her principal duties will be in connection with Maternity and Child Welfare Service, but he must be prepared to undertake any other duties relative to the Public Health work of the Council when required to do.

The salary is £500 per annum rising by annual increments of £25 to a maximum of [illegible] determined by [illegible] and the [illegible] Medical Council and [illegible] the Shoreditch [illegible] Borough Councils.

[illegible] obtained from [illegible] Town Hall, Stoke [illegible] on the official [illegible] form, accompanied by copies of three recent testimonials, should be sent to the Medical Officer of Health endorsed "Assistant Medical Officer of Health" and must be received not later than Saturday, January 23rd.

Canvassing directly or indirectly will disqualify.

Town Hall, C. KENT WRIGHT
Stoke Newington, N.16. Town Clerk.

A MANUAL OF RADIOLOGICAL DIAGNOSIS
FOR STUDENTS AND GENERAL PRACTITIONERS

By IVAN C C TCHAPEROFF, M A, M D, D M R E (Camb), Assistant Radiologist and Radium Registrar, St. Thomas's Hospital, London. Foreword by Philip H Mitchiner, M D, M S, F R C S

Crown 4to cloth, illustrated 21s net Post 8d An 8-page illustrated Prospectus is available

This manual is designed to furnish the Student General Practitioner and Candidate for the higher examinations, with a lucid and comprehensive account of the aids to diagnosis afforded by modern radiological methods To day every medical man is expected to recognise the salient points in a radiograph but the medical and surgical textbooks too often indicate that the diagnosis of a condition depends on the X ray findings without describing at all fully what these are This manual fills this gap The special process by which this book is printed gives great definition to the illustrations

FINANCIAL ASSISTANCE ARRANGED

ASSISTANTS.—MANY VACANCIES IN TOWN and County. Indoor and Outdoor. List on application.

Even the best regulated dynamos . . . .

cannot keep a battery up to its work in winter When the engine stops the available energy in the battery falls off as the battery cools Therefore, after standing overnight, it is in no fit state to turn over a cold engine—requiring a discharge of some hundreds of amps—and internal damage follows A Westric will "warm up" your battery overnight, restoring any lost energy, and enable a quick start to be made in the morning without overloading the battery

For 6 or 12 volt batteries **75/-** For A C mains only

Practices and Partnerships for Disposal (continued)

19 HOME COUNTIES.—Old established Practice of £800 p.a. in first rate town 20 miles from London. Panel over 800. Visits 3. No midwifery. Modern nine roomed house with garage and attractive garden—about quarter of an acre. Premium freehold house and Practice £1,000.

20 LONDON, S.E.—Well established Practice in suburban district. Receipts average over £650 p.a. including appointment worth £80/£100 p.a. and a panel of 650. Semi-detached house (11 rooms) with garden for sale. Scope. Premium one and a half years purchase.

21 LONDON, S.E.—Increasing Middle class Practice in pleasant suburb. Cash receipts past twelve months £1,250. Panel 900. Visits 6/6 to 7/6. Medicine sometimes included. Detached double fronted house with ample accommodation for sale or rent. Further scope for increase. Premium £2,400.

22 MIDDLESEX.—Nucleus of Practice in rapidly developing residential district about fifteen miles from London. Receipts last year £550. Lock-up consulting residence (4 bedrooms) with garage and garden. Premium house and Practice £1,000.

23 LONDON, W.—Practice of about £700 p.a. in residential district. Panel 500. Large corner house (7 bedrooms) with separate surgery entrance and good garden. Price of house £1,500. Scope. Premium two years purchase.

24 ESSEX.—Old established Practice in outlying suburban district run by two medical men averaging nearly £2,000 p.a. Panel 2,500. House (4 bedrooms etc.) for sale or rent. Premium two and a quarter years purchase.

25 S. COAST OF ENGLAND.—Partnership (after Preliminary Assistantship) in old-established Practice of about £2,500 p.a. in an important town. Appointments £250. Suitable house available to rent. A one-third share would be sold at two years purchase to a suitable man, preferably one holding the M.D. or M.R.C.P.

26 LONDON, S.E.—Old established Practice of about £1,000 p.a. in outlying residential district. Panel 1000. Detached house (4 bedrooms etc.) for sale. Premium two years purchase.

27 MIDLANDS.—Old established Practice of about £950 p.a. in country district. Panel 1,350. House (7 bedrooms etc.) for sale. Premium two years purchase.

28 S. COAST.—Partnership in old established Practice of about £1,650 p.a. in fashionable health resort. Panel 1,300 and appointments worth £150 p.a. Detached house with garage and garden for sale or to rent. Premium for one-third share two years purchase.

29 LONDON, N.—Old established Practice in suburban district. Cash receipts 1936 (10 months) £1,450. Panel 1,240 increasing. Fees 2/6 upward. Suitable house (9 rooms) to rent at £160 p.a. Premium £3,400.

30 LONDON, S.E.—Partnership in two Practices formerly separate but lately amalgamated in densely populated district. Total income £2,250 p.a. including Panel £1,750. Half share for disposal, alternatively one of the Practices—income £1,000 p.a. Panel £650—would be sold separately. Surgery premises £75 p.a.

31 HOME COUNTIES.—A small Practice about £400 p.a. in first rate town about 30 miles from London. Panel 140. Visits monthly from 5/. House with small garden to rent 25s. weekly. Excellent scope. Premium one and a half years purchase.

32 CHESHIRE.—Partnership in Practice averaging over £2,500 p.a. in good-class residential neighbourhood of a town. Panel 2,000. Visits 4/ to £1/1/. Partner should be aged about 30, hold University degree, have held house appointment and experienced in midwifery and anæsthetics. One-eighth share at first at two years purchase. Preliminary Assistantship.

33 N. MIDLANDS.—Partnership in old established country Practice averaging about £3,000 p.a. close to county town. Panel over 1,800. Visit 3/6 to 10/6 and a few at £1/1. Medicine extra. Specially built house in very pleasant district (6 bedrooms), garage and quarter acre garden for sale or might be rented. Scope for increase as building is going on. Premium one-third share £1,000 to include share of drugs etc.

34 HOME COUNTY.—Partnership in old established non-dispensing Practice averaging £3,000 p.a. in good residential district within 15 miles of London. Small Panel. Suitable house (4 bedrooms) to rent. Incoming partner should preferably hold the F.R.C.S. as there is a possibility of a hospital appointment. Premium one-third share two years purchase.

35 S. COAST.—Practice doing about £400 p.a. in rapidly growing seaside place. Panel 600. Detached house with 4 bedrooms, garage and good garden, rent £90. Good scope, building going on. Premium £400.

36 EAST COAST.—Partnership in well established Practice in seaport town. Receipts about £3,200 p.a. including good appointments and a Panel about 900. Capital share (3 bedroom) house for sale or rent. Premium (for one-third) share two years purchase.

37 WELSH COAST.—Old established country and seaside Practice. Cash receipts average £450 p.a. including appointments and Panel 272. Visits 5/ to £1. Net income £1,000. Suitable accommodation could be had. Bathing, boating, sailing etc. Premium £500.

38 BIRMINGHAM.—Practice averaging £850 p.a. in good suburb. Panel 420. Visits 4/ to 10/6. Ideal house for medical practice in good position containing about 4 bedrooms, attic, garage and garden, rent £75 p.a. Premium one year's purchase.

39 HAMPSHIRE.—Practice averaging £850 p.a. in nice residential district easy distance of the coast. Panel 400. No midwifery. Semi-detached house on main road with good garden for sale. Scope. Premium £1,500.

40 LONDON, S.W.—High class non-dispensing PRACTICE about £1,000 p.a. in residential district close to Mayfair. Fees £3/3/ to £5/5/. Excellent accommodation for purposes of practice, rent £200 p.a. Scope for increase. Premium one and a half years purchase.

41 LONDON, N.—Medical Woman's Practice in populous district. Receipts average about £560 p.a. including Panel 470. House with 4 bedrooms etc. to rent at £100 p.a. on lease. Premium £1,000.

42 W. MIDLANDS.—Partnership in Country Practice over £2,000 p.a. Panel 61a. Attractive small house (4 bedrooms) for sale or rent. Considerable scope. Premium one-half share £2,000 to include drugs etc.

43 LONDON, S.E.—Old established Practice averaging over £850 p.a. in thickly populated district. Panel 1,150. No midwifery. House on main road (4 bedrooms) with separate entrance to urgent accommodation for sale or rent. Good scope. Premium £1,500.

44 SOUTH AFRICA.—Medical Woman's Practice in one of the principal towns. Cash receipts last 12 months £1,250. House could be rented. Scope. Premium £500.

INFRA-RED RADIATION
IN GENERAL PRACTICE
The "Duplex" Apparatus

The present wide spread interest and use by the medical profession of this method of treatment is undoubtedly due to the remarkable results attending its application primarily in RHEUMATIC AND ALLIED DISORDERS, FIBROSITIS, SCIATICA, LUMBAGO, NEURITIS, SPRAINS, BOILS AND CARBUNCLES, PYLOROSPASM, ETC INSOFAR AS RHEUMATIC AND ALLIED DISORDERS ARE CONCERNED, THE EXTRAORDINARY RELIEF OF PAIN BY HEAT RAYS IS ABUNDANTLY CONFIRMED IN THE COMPREHENSIVE SURVEY INDICATED IN THE REPORT OF THE B M A COMMITTEE ON THE CAUSATION AND TREATMENT OF ARTHRITIS AND ALLIED CONDITIONS (see *B M J*, June 17th, 1933)

There is nothing new in the application of infra red radiation It is but the logical sequence of the epoch making discovery of Prof Finsen in 1883 The apparatus here described is the product of research for a simple yet highly efficient apparatus for the convenient application of this form of radiation, devoid of unnecessary elaboration, perfectly safe in use, and at a very moderate cost It is supplied in two models, one with fixed base and the other with collapsible base for visiting cases A long wave infra red non luminous generator with an interchangeable luminous heat bulb is provided Price complete for either model is 95/6

IMMEDIATE DELIVERY CAN BE GIVEN

A FULLY DESCRIPTIVE FOUR PAGE LEAFLET (J 500) ON THIS APPARATUS WILL BE GLADLY FORWARDED ON REQUEST

ZANT

A Non-poisonous, Non-irritant
Non-staining Germicide
with a Rideal-Walker value SIX

ZANT will not damage the skin even at full strength Used in the recommended dilutions its solution can be applied to delicate mucous surfaces without discomfort

ZANT is ideal in Obstetrics and Surgery It forms very effective Vaginal douches

ZANT is the result of long investigation by our technicians at Evans' Biological Institute, and owes its high germicidal power mainly to a new method of combining para-chlor-meta-xylenol

Issued in bottles 5-fld oz 1/- 10-fld oz 1/9 20-fld oz 3/-

WHOOPING COUGH

Detoxicated Whooping Cough Vaccine (Genatosan) has proved remarkably successful Reports received from medical practitioners state that it usually reduces the frequency of the paroxysms after the first injection, and subsequent injections almost invariably clear up the condition Owing to the elimination of the toxic elements of the germ during the process of manufacture, this vaccine may be given to infants and young children, in doses sufficiently large to produce the desired therapeutic effect, with an absence of harmful reaction

The following is typical of many reports received from physicians —

"I have been making a somewhat extensive use of your Detoxicated Vaccine for Whooping Cough, and am pleased to say that the results have been almost invariably gratifying In nearly all my cases the very distressing symptoms have disappeared after the third injection" ——————*M D*

Additional information regarding this Vaccine will gladly be supplied on request

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The 'Jelloids' are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated

Iron Jelloids

You are cordially invited to apply for samples for clinical test

CALSIMIL

Calcium Sodium Lactate and Vitamin D

In the prevention and treatment of chilblains

Calsimil in the form of palatable tablets is prescribed with signal success in the prevention and treatment of chilblains. The accompanying report from a physician in practice is evidence of their efficacy —

'... they seem better flavoured and more convenient than similar preparations. I used them for my own chilblains which disappeared entirely in the course of treatment.'

MANDELIX

(Elixir of Ammonium Mandelate B.D.H.)

The administration of Mandelix in the treatment of urinary infections presents advantages over treatment with mandelic acid, inasmuch as the latter necessitates the administration of 'two somewhat unpleasant medicaments, one followed closely by the other four times in the day' (Lancet, April 4, 1936, p. 769). On the other hand, in cases treated with ammonium mandelate (Mandelix) a second medicament to procure acid urine was unnecessary and, in all the patients so treated, 'a sterile urine was effected in a week or less, though all had a chronic infection'.

The conclusions reached, according to the above-mentioned report, were that '... in the light of this short experience, together with what is already known of mandelic acid treatment, we feel justified in saying that ammonium mandelate, suitably prepared, is a convenient means of administering mandelic acid, and that in the majority of cases the use of ammonium chloride can thereby be obviated'.

Titratable acidity as citric acid	0 9
Reducing sugars as invert sugar	12 4
Carbohydrates other than sugars (by difference)	0 38

P.S. Write to us on your letterhead and we shall be glad to send you a sample tin free of Dole Hawaiian Pineapple Juice.

COCONUT TREE CLIMBER—This native lad is climbing a Honolulu skyscraper with the greatest of ease He is after the green coconuts and the cool refreshing milk therein The malihini (newcomer to the Islands) always gets a thrill watching the native boys scamper up the tall palms Not infrequently young tourists attempt to imitate the tree walkers sometimes with painful results

A step in the right direction

New Cocoa process means improved nutrition for the masses

THE desirability of increasing the nutritional value of the diet of the masses is too obvious to need emphasis here Because it achieves this end without adding one penny to the cost of meals we believe the new predigestion process now used in making Rowntree's Cocoa will be of real interest to every medical man

This new predigestion process makes for improved nutrition in two ways —

1 The buffering power of Rowntree's Cocoa is increased by 10%—and consequently its role in the digestive process is increased accordingly It now makes even milk three times as digestible The increase in digestibility is particularly noticeable with the enzyme erepsin making this improved cocoa particularly beneficial to children Practically no indigestible protein now passes into the large intestine thus bacterial decomposition and the accumulation of poisonous substances in this region is avoided

2 The protein in Rowntree's Cocoa is now more digestible than that in other cocoas This means that it actually builds more bone and muscle than other cocoas—again a factor of particular value in the case of children

* * *

This improvement in Rowntree's Cocoa has been made without altering the delicious flavour in any way The price is also unchanged

MIL-SAN

The Scientific Contraceptive

. . . its efficiency

The basic principles on which the efficiency of MIL SAN depends are

a) A low pH caused by the reinforcing action of several acids which ensures the immediate immobilization and death of spermatozoa, despite the buffering action of the seminal fluid
b) An extremely low surface tension which causes it to spread rapidly and to penetrate the rugae of the vaginal and cervical mucous membrane
c) A degree of viscosity which ensures that it shall adhere to the cervix and upper vaginal tract and fornices forming a chemical barrier against the penetration of spermatozoa into the os uteri
d) A high degree of miscibility with the uterine secretions and seminal fluid which it renders fatal to spermatozoa.

It should be noted that no insoluble fats or oils are used Also that in manufacture packing and application all contact with metal is avoided There is therefore no danger of contamination with metallic salts

MIL SAN is non injurious acts immediately and does not depend upon heat, moisture foaming or other variable conditions It is simple to use hygienic, and designed to avoid damage to the vaginal flora The MIL SAN method of application by means of ready filled single application tubes is simple ensures the quantity maintains hygienic conditions and is proof against carelessness

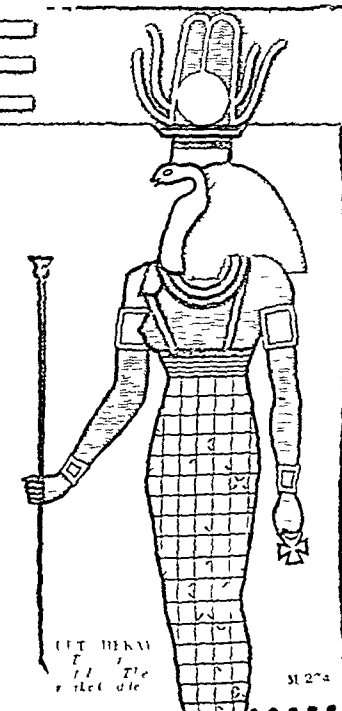
MIL-SAN

Full information and specimen tubes are sent on request to all interested members of the medical profession

VENOSINE LIMITED, 24, MAPLE STREET, LONDON, W 1 Museum 6760

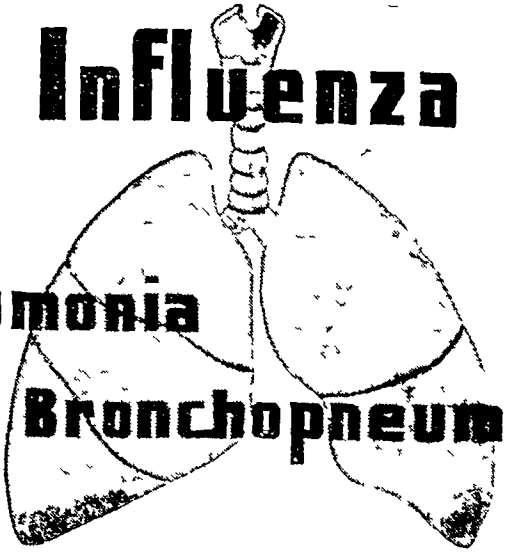
OVALTINE

BEFORE AND AFTER OPERATIONS



THE use of Ovaltine before a major operation is of great service in helping to build up the system against the strain involved by operative interference In abdominal cases especially where a light and unirritating diet is necessary the use of Ovaltine alone for a few days before the operation will be found sufficient to maintain the patient s nutrition at a sufficiently high level

After severe operations the regular use of Ovaltine is of the greatest service on account of its bland nature its ready digestibility and its highly nourishing and sustaining properties



Ovaltine is a complete food composed of fresh full cream milk eggs and malt extract in the form of crisp granules which dissolve readily in milk to form a delicious beverage acceptable to the convalescent patient

The Doctor was busy but NOT with INFLUENZA

Here is an extract from the report of a Bemax Medical Representative, dated January 4, 1937

*"Dr S— * always gives me a good interview Said he is very busy indeed—but not with Influenza which he puts down to the fact that his patients take Bemax as a regular addition to diet Dr S— is a Bemax enthusiast—said he cannot speak too highly of it, and hoped he could spare me more time next visit"*

* A North London M.D. M.R.C.S. M.R.C.P.

Useful as Bemax has proved itself in so many cases as a protective food in preventing Influenza, it is perhaps in Post-Influenzal Debility that medical men will discover its greatest value It is recognised that this condition yields most readily to a dietary rich in vitamins, so conveniently achieved by adding Bemax to ordinary diet Bemax is the richest-known source of Vitamin B (400 standard units per ounce), it contains also A and E with valuable salts of phosphorus

Bemax is inexpensive, palatable and easily assimilated It will be readily taken even when gastric symptoms are present

BEMAX

THE RICHEST NATURAL VITAMIN TONIC FOOD

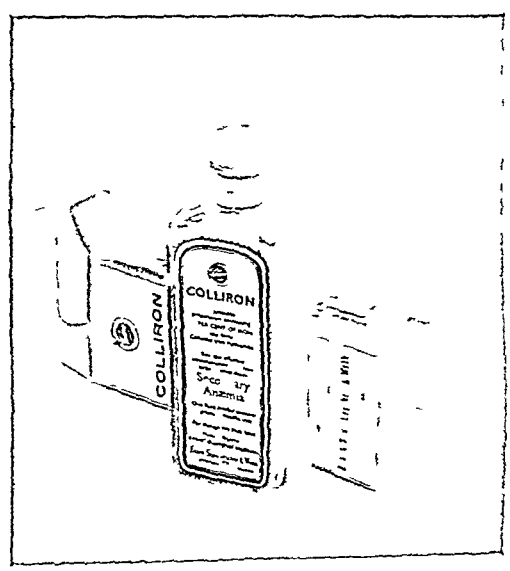
THE MICROCYTIC ANÆMIAS

COLLIRON



(Evans)

Colloidal Ferric Hydroxide
with a trace of copper

Colliron is of particular value in stubborn anæmias as it can be given in a heavy dosage, if desired, without aggravating digestive trouble It has proved to be very suitable for the treatment of anæmias associated with Pregnancy and Hæmorrhage

In every way Colliron is an ideal form of iron It is readily assimilated and is therefore prompt in its tonic action in debility and fatigue It is non-constipating and almost free from ferruginous taste

Being highly concentrated a small dosage suffices for average conditions

THE DOSAGE OF COLLIRON

5 minims of Colliron contains the same amount of iron as a Blauds Pill

Adults	20 minims three times daily after meals, or for intensive treatment, one teaspoonful once or twice daily increasing to one tablespoonful two or three times daily
Children	5 to 10 minims three times daily after meals, or for intensive treatment, 15 to 30 minims once or twice daily, increasing to one dessertspoonful two or three times daily

Colliron is issued in

4 fld oz bottles - 3/-
8 " " - 5/-
16 " " - 9/6
80 fld oz bottles - 40/- (Hospital size)

may modify temporarily the course of the disease, whatever its basic cause may be

First, rapidity of mobilization may be increased by a stimulus which is often an infection, but which may be purely psychic and may suddenly convert a comparatively mild case into a very grave one When this happens enormous doses of insulin may prove to be insufficient to reduce the hyperglycaemia until the stimulus has subsided An alternative explanation of the huge doses required is that the infection interferes directly with the action of insulin, but this has not been proved, and if it really were the case we should expect to find glycosuria in non-diabetic persons whenever they were subjected to a profound toxaemia Secondly, the functional capacity of the utilizing tissues has to be considered The muscles differ from any machinery known to us in that they can burn themselves to provide their own fuel Muscles must have carbohydrate in order to function, and if it is not supplied they will destroy themselves in order to produce it It would seem unreasonable to expect them, while so engaged, to use fuel to their maximum capacity This, I believe, is the explanation of the benefit seen in the modern high carbohydrate diet, as it renders this wasteful chemical process unnecessary, and it also explains in many diabetics the improved tolerance, which may continue long after their insulin dose has been apparently stabilized

These factors—the rapidity of mobilization and the health of the tissues—must be borne in mind in every case that is under treatment, and a careful search should be made for septic foci in teeth and tonsils, and in particular for tuberculosis of the lungs If insulin is to be regarded as a diagnostic as well as a therapeutic weapon it must be remembered that it will lower the blood sugar, temporarily at any rate, in every one, whether there is any pancreatic deficiency or not, and if the pancreas be normal there will be overstorage, and we will be dealing with a toxicological rather than with a pharmacological effect This is a point which I cannot emphasize too strongly

Twenty years ago the state of the urine was regarded as the criterion of successful treatment Later the recognition of renal glycosuria showed that this might be fallacious, and the blood-sugar level took its place Taken by itself a fall in the blood-sugar level may be equally fallacious, and it can only be considered beneficial if it be accompanied by an improvement in the patient's general health

Increased Mobilization

In the first group, due primarily to overproduction, are the comparatively rare cases following acromegaly, in which there is a pituitary overactivity, and in them, as would be expected, the response to insulin is poor Probably many of the cases associated with hyperthyroidism also belong to this group It is a not very uncommon combination, and in my experience these cases do badly both with diet and with insulin, and the only successful treatment I have seen has been the prompt removal of the thyroid, although insulin may have to be continued after the operation, as there is often a combination of defects Thus in a woman aged 55, with a basal metabolic rate of +52 per cent, the urine was loaded with sugar and acetone, and the fasting blood sugar was 0·395 gram per 100 c.cm despite 50 units of insulin a day Thyroidectomy was performed, and the urine is now sugar-free and the fasting blood sugar is 0·162 gram per 100 c.cm on 20 units daily, and the patient is in good health

In a certain number of cases the primary lesion appears to be in the brain itself There may be a history of overanxiety for some time prior to the illness, or a family history of nervous instability, and while 70 per cent of adult diabetics give a history of obesity these patients may have been thin always I invariably suspect overmobilization if such a history is obtained I will quote two cases in illustration of this

Case I

A girl, aged 18, had a history of meningitis (cause unknown) in infancy Two brothers had died of meningitis and another brother later committed suicide Sugar was discovered in her urine prior to an operation for chronic appendicitis She was dieted and underwent the operation successfully For the next two years she remained in good health, but it became more and more difficult to keep the blood sugar at the normal level and the urine free from sugar When insulin was introduced into this country it was therefore decided to try it For a time she became sugar-free, but her health did not improve, she became obese, and in spite of the fact that she had several alarming reactions after exercise it became impossible to keep her free from sugar, and a further increase of the dose of insulin made her ill For a time she was in the London Hospital, under the care of Dr Otto Leyton, to whom I am indebted for further information It was found that when given a dose of 50 units of insulin just before a meal containing only 5 grams of carbohydrate the blood sugar fell very slowly from 0·25 to 0·167 gram per 100 c.cm in eight and a half hours Without insulin the fasting blood sugar varied from 0·26 to 0·16 gram per 100 c.cm Dr Leyton agreed that she was resistant to insulin, and its use was discontinued Although insulin produced no clinical improvement it did produce two effects—hypoglycaemic attacks and obesity

The hypoglycaemic attacks, which always occurred after exercise, showed that the muscles were capable of utilizing sugar, but insulin had interfered with the supply and the obesity was apparently the result of overstorage After insulin had been discontinued her health improved, and she continued to live a normal life on a moderate dietetic restriction and without insulin, until she dislocated a cartilage in the knee She said this made life unbearable In view of the previous successful appendicectomy the risk of another operation was not considered to be an undue one, and it was accordingly performed Acetone appeared in the urine in large amount two days later, and in spite of the administration of 600 units of insulin, which had no effect whatever on the blood sugar, a fatal coma developed a week later Unfortunately the brain and pituitary could not be examined, but Dr Susman, who examined sections of the pancreas, and who at that time knew nothing of the history of the case, found that the islet cells were few in number, were largely made up of alpha cells, and a few showed degeneration He reported that "the features as a whole suggest that the pancreas and islet function have been interfered with through paralysis of the nerve supplying the pancreas, the histological findings closely resembling those described by Opie as due to paralysis"

Here, although there was a deficiency of islet tissue, the case was definitely resistant to insulin, and there was no defect of utilization I can only explain it as one in which the primary lesion was due to disturbance of mobilization arising from meningitis in childhood, mobilization being so stimulated by operation that a profound ketosis developed, terminating in coma Another point in this case, which I think should be emphasized, is that for a time insulin brought the blood sugar to normal, but as a result made her fat and ill

Case II

Another case, a male aged 53 developed diabetes after a prolonged period of overwork He complained of palpitation nervousness, and tremulousness, but the basal metabolic rate was not increased and an x-ray of the pituitary fossa was normal He responded poorly to insulin The fasting blood sugar varied from 0·26 to 0·365 gram per 100 c.cm, even

made her feel worse There was a considerable anaemia, and as it was associated with numerous retinal haemorrhages (a very rare condition in uncomplicated diabetes under middle age) I had a blood count done This showed a typical pernicious anaemia Insulin was stopped and liver treatment substituted, and she is now able to take a diet containing 8 oz of bread without any insulin at all, and she has since remained in good health

A still more remarkable case was admitted to the Infirmary in June, 1936 A woman of 56 was on the verge of coma, the urine was loaded with sugar and acetone and the blood sugar was 0 336 gram per 100 c cm A blood count showed 1,830,000 red cells, 44 per cent of haemoglobin, and a colour index of 1 22 There was also auricular fibrillation Owing to the proximity of coma it was felt to be unjustifiable to withhold insulin altogether, and she was given two doses of 15 units on the day of admission and liver injections were started immediately No more insulin was given, and the red cell count dropped to 980,000 during the next three days, but after that a rapid improvement set in and two months later the count was 4,018,000, with 78 per cent of haemoglobin, and on an ordinary diet without insulin the fasting blood sugar was 0 19 gram per 100 c cm

Effects of Arteriosclerosis

Perhaps the most difficult group is that in which arteriosclerosis is the predominant feature Here the glycosuria is often mild—apart from an infection there is no acetonuria—the diabetic symptoms are not severe, and there may be no loss of weight Often, indeed, sugar is discovered accidentally when the patient comes under treatment for some condition such as gangrene, carbuncle, cataract, or a coronary thrombosis It may be that the glycosuria clears up spontaneously for a time, and every surgeon is familiar with cases of carbuncle and gangrene in which the sugar disappears after the infection has been dealt with In some of these patients a considerable improvement follows the administration of insulin, and in them the usual explanation that we are dealing with an arteriosclerosis of the pancreas is probably correct In others, however, only a partial improvement or no improvement occurs, and a defect in some factor other than the pancreas may be responsible What this factor is I am unable to say, possibly it is an insulin kinase as postulated by Himsworth, but I believe that here the primary condition is not an inability to store glucose and make it usable, but an inability of the tissues to use the sugar

I have already mentioned the question of efficient utilization and I will now return to it in more detail, as its importance is often overlooked Diabetics are liable to attacks of hypoglycaemia when taking insulin Now hypoglycaemia may be due to one of three causes

(i) A deficient mobilization of carbohydrate such as occurs in von Gierke's disease,
(ii) Overstorage, or
(iii) Over-utilization

In young diabetics these hypoglycaemic attacks are most likely to occur after exercise—that is, although the capacity to store is deficient, utilization is unimpaired In the arteriosclerotic group exercise is an uncommon cause of hypoglycaemia Hypoglycaemia does occur but it is of a different type, it may come on at any time, possibly during the night and does not seem to follow any particular exertion Often excess of insulin is shown not by any definite attack but by a feeling of vague ill-health periodic headaches or an increasing obesity Priscilla White has shown that even young diabetics may develop arteriosclerosis if given too much fat, and clinically we find that a young patient who in the early stages of treatment was very liable to hypoglycaemic attacks after exertion gradually becomes free from them Here the most probable explanation is that a developing arteriosclerosis adds an impaired utilization to the clinical picture

At the same time the renal threshold tends to rise, and the patient will often tell you that he only feels well when the blood sugar is considerably above the figure of 0 1 gram per 100 c cm This heightening of the renal threshold is commonly found in arteriosclerotic diabetics and I regard it as not due to any deficiency of the kidneys but rather to a conservative process It is necessary for these people that the blood sugar should be considerably above the normal level in order that they may overcome a deficient utilization Indeed I have seen an arteriosclerotic diabetic who was in insulin coma, although the blood sugar was exactly 0 1 gram per 100 c cm Later I again examined the blood when he was feeling well, and although sugar-free the fasting level was then 0 225 gram per 100 c cm

The optimum level for a particular person therefore may be very much above the so called normal level, and the distinction between the two is of great practical importance Arteriosclerosis is a gradual process which may take many years to develop, and, like diabetes, it may be strongly hereditary When examining cases inquiry should be made not only about a history of glycosuria in other members of the family, but whether there has been any liability to the arteriosclerotic forms of heart disease, cerebral haemorrhage, or gangrene There is often a history of obesity in these cases, usually of long standing, but when the symptoms of diabetes develop the loss of weight may be trivial There is no history of a rapid increase followed by a rapid decrease of weight such as I have described in the pancreatic cases, and despite the obesity acetonuria does not arise except in the presence of an infection In some of the cases there appears to be an associated pancreatic defect, and insulin may be required either permanently or temporarily but in others it either has no effect or it makes them definitely ill

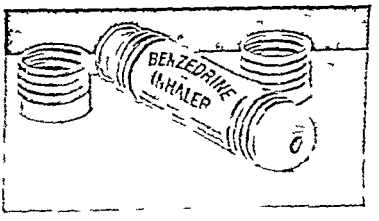
We can only find out what its action will be by a cautious trial, relying not on the blood sugar, the optimum level of which we cannot know for each particular patient, but on the clinical findings I will quote two instances to illustrate the type of case to which I am referring The first is so mild that it cannot be called a true diabetes

A female, aged 25, complained of boils, and a little sugar was found in the urine This disappeared after infection had ceased, and a blood-sugar curve taken then was normal There were no symptoms of diabetes, the general health was good, and there was no obesity Her father had had diabetes and gangrene of both legs, and a sister, aged 45, weighed 18 st and had had glycosuria for many years

My interpretation of this case is that she is a potential arteriosclerotic with a defective utilization The boils led to a stimulus of mobilization and sugar appeared temporarily, but a normal blood-sugar curve showed that storage was normal In the course of time she will become an arteriosclerotic diabetic like the rest of her family A second case was more advanced

A woman aged 46 complained first about her eyesight, and incipient cataract was found in both eyes There were no symptoms of diabetes She felt well, and had no loss of weight the blood pressure was 180/86 mm Hg and the urine contained sugar but no acetone and no albumin The blood sugar was 0 203 gram per 100 c cm Her father had had diabetes with cataract, and died of arteriosclerosis and heart failure She was given a diet of 2,400 calories and 20 units

THE "WHY" OF BENZEDRINE BRAND INHALER



THE structure of the rhinological tract is so complicated that, when congestion is present, the whole of the affected area cannot easily be reached by a liquid vasoconstrictor On the other hand, a volatile vasoconstrictor diffuses throughout the entire nasal cavity

Benzedrine Brand Inhaler is a vasoconstrictor combining volatility with a potency greater than that of ephedrine It is an aluminium tube with closely-fitting screw-caps, containing a cotton roll impregnated with β-Phenylisopropylamine (Isomyn) or 'Benzedrine'

Thus, though the word 'inhaler' may suggest the outmoded aromatic inhalers of the past, actually this presentation is logically dictated by the properties of the drug itself And Benzedrine Brand Inhaler—effective, convenient, and inexpensive—marks a distinct therapeutic advance in the symptomatic treatment of head colds, sinusitis, vasomotor rhinitis, hay fever, and nasal congestions generally

Each tube is packed with β Phenylisopropylamine (Isomyn) 325 gm Oil of Lavender 097 gm and Menthol 032 gm

Benzedrine is the Registered Trade Mark of Smith Kline & French Laboratories to designate their brand of β Phenylisopropylamine (Isomyn)

It is of interest to note that Vinson (1928) compared the frequency of the incidence of haemoptysis in one hundred unselected cases of pulmonary tuberculosis, of mitral stenosis, and of chronic bronchiectasis, and he found that this was greatest in the last-mentioned disease From his observations he concluded that pulmonary tuberculosis was regarded as the usual cause of haemoptysis merely because of the frequent and widespread prevalence of the infection whereas the actual relative incidence of haemorrhage was greater in other less commonly recognized pulmonary lesions Wurtzen (1936) also recorded that of 5 264 admissions into a sanatorium between January, 1929, and August, 1935, 869 cases were admitted on account of haemoptysis, and it was found that only 582 of these 869 patients were suffering from pulmonary tuberculosis Thus in approximately one out of every three cases the cause of the haemoptysis had been misinterpreted, and the actual causative lesions found in these 287 incorrectly diagnosed cases were pneumonia in fifty cases, new growth in twenty, cardiac disease in sixty, and epistaxis in fifty-eight

The development of x-ray examination of the chest was the first great advance in the positive differential diagnosis of pulmonary pathology, and the value of this has been enhanced within the past ten years by the use of contrast material within the bronchi (lipiodol, etc) and the perfection of the technique of bronchography Following the introduction of radiological examination of the chest it was found that in many cases of haemoptysis there was no demonstrable pulmonary lesion, and in such cases it was assumed that the source of the haemorrhage was a tuberculous focus near the hilum This assumption prevailed until further assistance in diagnosis was rendered by bronchoscopy, and to day the bronchoscope is very slowly being recognized as an instrument of precision for the diagnosis and treatment of bronchial and pulmonary lesions and not merely as a mechanical means for the extraction of foreign bodies from the bronchial tree In 2 per cent only of the patients treated at Chevalier Jackson's clinic (1934a) was bronchoscopy performed for such accidents notwithstanding an enormous increase in the number of foreign body cases In *The Eye, Ear, Nose and Throat* (Practical Medicine Series, 1931, p 570) it is stated that the history of the progress in the more accurate understanding of diseases of the chest runs *pari passu* with the more widespread use of bronchoscopy,' and its immense value in this respect has been aptly compared with the value of the cystoscope in genito-urinary disease

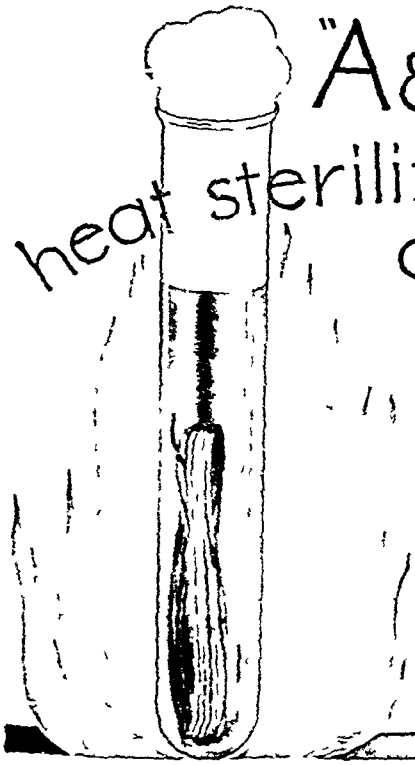
Haemoptysis of Unknown Origin

Gerlings (1935) has written that "bronchoscopy as a diagnostic procedure is indicated, in fact is indispensable in certain cases of haemoptysis of unknown origin Recognition of the causative disease can only be made by bronchoscopy" In a series of several hundred cases referred for bronchoscopy for all causes we have encountered six patients suffering from recurrent haemoptysis who exhibited no physical or radiological signs of pulmonary disease In these six cases the causative lesion was found by bronchoscopic examination to be one of the following tracheal varix, chronic non specific granuloma simple new growth, or malignant neoplasm



The nomenclature used in the following case histories to indicate the situation of the lesions is based on the description of the bronchi given by Nelson (1934) and a semi diagrammatic picture of the main bronchi and their branches is shown in Fig A

Tracheal Varix

Haemoptysis without physical or radiological signs occurred in one patient of the present series, and the source of the bleeding was found by bronchoscopy to be a varix of the tracheal wall

Case 1—A male aged 60 complained of recurrent haemoptyses for five months and while under observation he coughed up bright red aerated blood on more than one occasion Clinical examination and repeated direct and contrast radiological examination did not reveal any manifest abnormality in the chest The patient was known to have a chronic juxtapyloric peptic ulcer which was shown by x rays The sputum was negative for tubercle bacilli, and the blood Wasserman reaction was negative

Bronchoscopy showed a varicosity about 1½ cm in length by 1 cm in breadth on the left antero lateral wall of the trachea immediately above the bifurcation (Fig 1 Special Plate) This area bled during examination, and was the

bronchoscopically, one is obliged to concede that the only means of making a definite diagnosis of benign neoplasms in the bronchus in a living patient is by bronchoscopy"

Malignant Neoplasms

Malignant neoplasms of the bronchi are common, their manifestations are legion, and their symptoms may appear in manifold guises—asthma, tuberculosis, unresolved pneumonia, lung abscess, bronchiectasis, etc, may all be simulated It is now recognized that carcinomata arise primarily in the bronchi either from the mucosa or from the deeper glands in the submucosa, and Kramer and Som (1936) have concluded from an analysis of a large series of cases that 62 per cent of these growths occur in the larger bronchi, 15 to 20 per cent in the small branch bronchi, and that parenchymal carcinoma is very rare It is the experience of the writers of this article that the majority of bronchial carcinomata arise within the first half-inch of the main bronchi below the tracheal bifurcation A large number of growths are therefore within easy access of the bronchoscope, and Jackson (1934c) has written that the "bronchoscope affords the only means of making an early and positive diagnosis of malignant disease of the bronchi and lungs,' and that "a cancer no larger than a grain of wheat can be found in the bronchus and removed for histologic examination if only the opportunity for bronchoscopy is afforded"

Haemoptysis is a common symptom in cases of malignant neoplasm of the bronchi Farrell (1936) analysed the clinical signs in a series of fifty cases of bronchial carcinoma, and he found that haemoptysis was present in 48 per cent of cases, though not necessarily as an early symptom Ormerod (1933) is of the opinion that in the early stages the sputum is merely blood-streaked, and as the disease advances the haemoptysis ceases, to reappear in the later stages as profuse haemorrhages

Three cases of carcinoma of the bronchus are described below in which haemoptysis was the only sign present All of the cases had been fully investigated clinically and radiologically, and they bear out Hudson's (1933) contention that bronchial neoplasms can be recognized endoscopically before they can be detected by x-ray examination

Case IV—A female, aged 37, complained of recurrent haemorrhages from the chest with after-weakness' of two years duration Physical signs were absent, and repeated direct x-ray examinations and lipiodol bronchography were negative The sputum was negative for tubercle bacilli, and the blood Wassermann reaction was negative Bronchoscopy revealed a small haemorrhagic fungating area at the junction of the right middle and lower lobe bronchi (Fig 4, Special Plate) It was impossible to remove a piece of tissue for examination but clinically there was no doubt as to the nature of the lesion

Case V—A male, aged 49, complained of pain in the left chest morning cough slight dyspnoea, and recurrent haemoptyses of nine months duration Routine clinical examination did not reveal any evidence of organic disease Repeated direct x-ray examinations and lipiodol bronchography were negative Fig 7 (Special Plate) shows the normal bronchogram of this patient His sputum was negative for tubercle bacilli and the blood Wassermann reaction was negative

Bronchoscopy showed an early carcinoma affecting the anterior wall of the left lower bronchus immediately above its division into its terminal branches (Fig 5, Special Plate) The biopsy report was bronchial carcinoma Ten 1 5 millicurie radon seeds were inserted into the growth

This patient was examined three months later by the bronchoscope and the tumour had then entirely disappeared, there remained only some congestion of the bronchial mucosa over the situation at which the radon seeds had been implanted A Tudor Edwards radon carrying tube was inserted into the lumen of the bronchus for a week subsequently

Case VI—A female aged 24, complained of cough and recurrent haemoptyses of ten months duration She stated that she had been investigated previously in hospital and discharged as a case of bleeding from the gums She was admitted to Fazakerley Sanatorium, where routine clinical examination was negative Direct x-ray examination by D A E Connolly and lipiodol bronchography showed no pulmonary lesion Her sputum was negative for tubercle bacilli and her blood Wassermann reaction was negative

We performed bronchoscopy with the consent of Dr Cra and this revealed an early carcinoma affecting the lateral aspect of the left main bronchus (Fig 6, Special Plate) She was discharged from the sanatorium as non tuberculous and admitted to the Royal Southern Hospital, where ten 1 5 millicurie radon seeds were inserted into the growth Fig 8 (Special Plate) shows the radon seeds in position and indicates the situation of the growth

The morning haemoptyses persisted and three months later although physical and radiological evidence of disease was still absent, bronchoscopy showed that the neoplasm had progressed very considerably, and a further ten radon seeds were inserted into the growth It was impossible to obtain a piece of tissue suitable for histological examination, but the clinical picture left no doubt as to the malignant nature of the tumour

Malignant bronchial neoplasms do not give rise to radiological signs until the growth has spread so as to partially or completely occlude a bronchus, has infiltrated the lung parenchyma, or has given rise to secondary deposits in the mediastinal glands We have encountered cases of proved bronchial carcinomata in which previous repeated x-ray examinations have shown no abnormality over periods extending up to two years All such growths are infiltrative, they cause early fixity and rigidity of the bronchial wall with a consequent absence of the normal bronchial movements, and even before true tumour formation has occurred the bronchial markings will be distorted or absent, or the rings will appear to be drawn together Thus a characteristic picture is produced which can be identified readily with the bronchoscope

Several cases of haemoptysis due to secondary involvement of the trachea or bronchi from primary oesophageal or thyroid neoplasms without clinical or radiological pulmonary signs have been observed, but these have not been included in the series, as the causative lesion left no doubt as to the origin of the haemorrhage

Technique

Except in patients who were very ill, bronchoscopy has been carried out with local anaesthesia This is a safe and painless procedure if performed with gentleness and consideration for the patient, and it is no exaggeration to state that several of our patients have requested further bronchoscopic intervention following the relief they had experienced from therapeutic bronchoscopy Anaesthesia is induced by preliminary spraying of one nasal fossa, the pharynx, and the laryngeal vestibule with a 5 per cent solution of cocaine hydrochloride diluted with an equal quantity of liq adrenaline 1 in 1,000 from a de Vilbiss No 15 atomizer A No 5 gum elastic catheter is passed through the anaesthetized nasal fossa, then through the glottis, and 2 to 3 c cm of the anaesthetic solution is injected directly into the trachea Anaesthesia is sufficiently profound after a lapse of ten minutes to permit the passage of the bronchoscope with very little discomfort to the patient, and in no case has any anxiety been caused following the use of the cocaine and adrenaline solution of this strength The bronchoscope is introduced directly into the larynx without the additional aid of a direct laryngoscope, as this latter manœuvre has been found

THE RESULTS OF CORNEAL TRANSPLANTATION *

BY

J W TUDOR THOMAS, D.Sc., M.D, M S., F R C.S

Honorary Ophthalmic Surgeon Cardiff Royal Infirmary, Associate Surgeon in Charge of Corneo-Plastic Department Central London Ophthalmic Hospital

(WITH SPECIAL PLATE)

In this paper it is intended to present an account of the results of corneal transplantation as carried out by ophthalmic surgeons in recent years The numerous operations during the hundred years dating from the early part of the nineteenth century were nearly all failures, and will not be discussed in this paper Opinion in this country was summarized by Sir John Parsons in his textbook *Diseases of the Eye* in 1924 in the following words

'Keratoplasty, or the excision of a small disk of scarred cornea, and its replacement by a disk of rabbit's or human cornea is practically never successful, the transplanted tissue rapidly becomes opaque"

It is now recognized that successful results by corneal transplantation can be obtained, but conclusions as to the value of the procedure can only be based on published papers containing details of all the cases attempted—successes and failures—rather than on publications describing isolated successful cases In this paper a summary of my own results will be given, together with those of Elschnig, Filatov, and Castroviejo

Scheme of Classification

Inasmuch as the technique of the operation varies according to the ideas of the surgeon concerned, it becomes of interest to compare the results obtained by the different methods Such a comparison is not easy, because the standard of success is not uniform, and the methods of recording results are individual and arbitrary A scheme for the classification of the cases operated on is given in this paper, and a simple method of recording the results If other surgeons would adopt this classification and summarize their results in a uniform manner it would greatly facilitate the comparison of results that will be necessary to establish the best operative technique Complicated and involved schemes might be put forward, but probably the more complicated they are the less one could rely on the accuracy of the information conveyed The simple scheme which is suggested would convey accurate and valuable information, the necessity for the various groupings is based on practical experience It would indicate clearly under which headings the type of case, and the result, should be classified, and can be incorporated in the publication of details of cases as a convenient form of summary The eyes should be classified into three main groups, and the results of each group given separately

Group A —Suitable eyes in favourable patients

Group B —Suitable eyes in unfavourable patients—for example in a baby or a patient with much nystagmus, much photophobia etc

Group C —Unfavourable eyes by reason of

(*a*) Extra ocular conditions—for example, symblepharon

(*b*) Intra-ocular conditions—for example ante staphyloma, leucoma adherens, chronic irideo with secondary cataract, etc

(*c*) Intra-ocular and extra ocular conditions

By the term "suitable eye" is meant an eye with a opaque cornea, a fairly normal anterior chamber, reas ably good tolerance of light, and normal tension Th conjunctival sac should be clean and free from gros abnormality Some surgeons who find that results va according to whether the cornea is completely scarred o contains some transparent tissue like to subdivide th cases on this basis The above scheme could be adapted to this purpose by splitting Group A into two subgroup —(i) and (ii)

Scheme for Recording Results

In general the primary test of success is the degree o transparency of the graft and the absence of an opaq new membrane immediately posterior to it The objec of the operation is to produce a graft that will remain clear, and if this object is accomplished the operation must be considered successful though it may be on a defective eye whose vision, even though a transparent graft, may be extremely poor It is therefore on the basis of transparency of the graft after a period of, say, six months that the results should be analysed, rather than on the visual results, which so frequently require explanations and references to other abnormal states of the eye before they can be assessed at their correct values This scheme does not preclude details of visual acuity from being recorded, and although intended as a useful form of summary can well be utilized as a classification for the publication of details of individual cases

It should be clearly indicated whether the figures refer to the number of operations or the number of eyes operated on The former is desirable as it would include all the failures, but there is no reason why both should not be summarized The following six headings will include all types of results and are suggested as easy groups for the classification of corneal grafts

Successes	Group 1	Clinically transparent
	Group 2	Slight degree of opacity in or behind graft
	Group 3	Much opacity—but less than original corneal opacity
Failures	Group 4	Much opacity—equal to, or worse than, original corneal opacity
	Group 5	Graft detached
	Group 6	Eye lost

By classifying results in this way one can see at a glance how successful or how poor the results are Groups 1, 2 and 3 are successful in their various degrees and Groups 4, 5, and 6 are failures I would emphasize the fact that a new formation of opaque tissue immediately behind the graft, so prone to occur in eyes with old iridocyclitis or leucoma adherens must be considered as part of the graft and however clear the stroma of the graft the endothelial opacity must be accepted and assessed for the categorical record of the result

Results of Operations

For the purpose of comparison, and in order to form a true estimate of the value of the operations for corneal transplantation, one should know the results of all the operations of that nature performed by the surgeons concerned Isolated reports of successful cases, although of interest and encouraging, do not form a true basis for an estimate of the chances of success of the operation and how the chances vary under certain conditions Si

CLASSIFICATION OF THE GLYCOSURIAS*

BY

T H OLIVER, M D, F R C P

Honorary Physician Manchester Royal Infirmary

If the mortality statistics of diabetes mellitus be consulted it will be found that the expectation of life for all classes of the disease has been increased by some three and a half years since the introduction of insulin On analysis it will be seen however, that this gain is confined entirely to the younger patients and after the age of 55 the mortality has continued to increase at approximately the same rate as prior to 1922 This surely is a fact of the greatest significance, and while the value of insulin cannot be overestimated, anyone with a considerable experience of the disease can recall a number of cases in which it has failed to produce the results expected of it This failure is commonly, and often rightly attributed to the patient's inability to keep strictly to the regime prescribed for him but in a proportion the blame is unjust and the failure lies elsewhere

The glycosuria of a man of 80, which has been present for twenty years and the acute diabetes of a child of 8 may both give the same fasting blood sugar figures and both are labelled as diabetes but clinical experience teaches us that the outlook and the treatment necessary differ entirely in the two cases In other words we have not made a sufficient attempt to differentiate the types of glycosuria and may use our remedy blindly in cases where the primary fault is not a deficiency of the pancreas

Unfortunately this confusion is increased as many text books of medicine state definitely that diabetes mellitus is due to a deficiency of islet tissue though physiology has demonstrated that glycosuria may be due to a large variety of causes Again, statistics show that while the mortality in patients under 14 is due to coma in 100 per cent of the cases in patients over 75 no deaths are due to this cause and in fact the liability to coma decreases continuously as the age advances So while the young patient dies directly from the disturbance of his metabolism in the older one the complications are the dominant factor a fact which alone suggests a wide difference of aetiology

Carbohydrate Metabolism

The classification of the cases is therefore a matter of supreme importance in deciding both on the prognosis and on the line of treatment to be followed and it can only be attempted if we bear in mind the physiology of carbohydrate metabolism and differentiate our cases on this basis Before trying to make such a classification I would recall certain facts in the complicated subject of carbohydrate metabolism

Three groups of organs appear to be involved In the first we have the nervous system, the pituitary the thyroid and the adrenals which seem to be concerned with katabolism and the mobilization of carbohydrate from the carbohydrate stores The production of glycosuria by nervous stimuli has been known for many years but the fact that it only occurs when the pituitary is intact suggests that its action is an indirect one Recently an extract of the anterior lobe of the pituitary has been prepared which will produce hyperglycaemia, ketosis, and lipaemia in a normal dog One school considers that many cases of diabetes mellitus are primarily due to a pituitary overactivity Again the thyroid will produce an increased breakdown of liver glycogen and the blood sugar curve in hyperthyroidism may closely resemble that of a case of mild diabetes mellitus Although I am unaware of any case of permanent glycosuria due to an overaction of the adrenals the action of adrenaline in producing hyperglycaemia is well known and as it does not occur if the liver has been removed it is almost certainly due to a breakdown of liver glycogen

In the second group we have the islet tissue and though fourteen years have elapsed since the discovery of insulin its action is still incompletely understood It does appear however to be concerned with the storage of glucose as glycogen, and it seems that glucose must undergo this process before it can be used by the tissues Insulin is therefore anabolic and in some respects antagonistic to the first group

Thirdly we have the liver and the muscles which are the great storehouses of carbohydrate The latter also are the principal users of sugar but their share in the production of glycosuria I will leave for the moment, until I am discussing the subject from its clinical aspect

Possible Causes of Hyperglycaemia

There would appear then, to be four possible causes of hyperglycaemia

1 An increased katabolism leading to an increased mobilization of carbohydrate and fat from the storehouses in which the nervous system the pituitary the thyroid and possibly the adrenals are involved

2 A diminished capacity to store owing to lack of insulin

3 A defect in the storehouses themselves—the liver and muscles

4 An inability of the tissues to use

Unfortunately the cases are not always clear-cut—two or more organs may be involved or the disturbance of one organ may throw such a strain on another that it, too gives way Nevertheless I will attempt on this basis to make a clinical classification of the glycosurias Before doing so I would draw attention to two factors which

* Presidential address delivered on October 14 1936 to the Manchester Pathological Society

suitable cases success by corneal transplantation, resulting in a clear or partially clear graft, appears to be as follows

Elschnig	46 per cent
Filatov	43 ,,
Castroviejo	81 ,,
Thomas	83 ,,

This comparison would be rendered much more accurate if the scheme outlined in this paper were utilized as a summary in future publications on this subject To put the results on a very broad basis, the results of all four surgeons (by various operative techniques) show that in 216 operations on suitable cases 110 were successful—that is, about 50 per cent—and in 338 operations on all the cases, favourable and unfavourable, 131, or 38 per cent, were successful These figures indicate that corneal transplantation is now an operation offering a good chance of improvement in a suitable case The figures for my own cases would indicate that the chances of obtaining a graft that can be described as transparent are about 27 per cent

I feel justified by the results quoted in stating that in suitable cases corneal transplantation has now ceased to be an experiment and is a practical procedure That does not mean, however, that advance in this form of treatment will not take place in the future By continuing to work on a certain form of treatment ways and means are discovered to render that treatment more effective, and to improve the operative technique The experience of surgeons with their individual operations must be carefully considered with a view to the establishment of a technique which is the most reliable and which gives the best results The future, I am convinced will bring still better chances of success for the suitable cases, and there is some justification for the view that, with a continuance of earnest effort, it will become possible to do a great deal more for many of those cases now classified as unfavourable

M Grunberg and F Jonckheere (*Scalpel* Liege, November 7, 1936, p 2326) refer to a previous article (*Brux med*, October, 1936, No 52, p 1854) in which it was shown that it is possible to demonstrate, by means of radiography the site of a perforated gastric ulcer after suture A case is reported in which a patient of 36 had suffered from a chronic gastric ulcer of the lesser curve This had penetrated into the left lobe of the liver to which it was adherent Operation for perforation was carried out the liver being freed and a large indurated perforation, 2 5 cm in diameter, was found This was closed by a Lembert suture, which was placed across and at right angles to the lesser curve A second serous suture was inserted over this Radiography fifteen days later showed the typical "figure of three" on the lesser curve where the perforation had been and indicated that a Lembert suture placed just beyond the edges of the perforation will result in inversion of the edges Two further cases are reported and illustrated in which the same method of suture was used for small perforations In these cases radiography after operation showed an identical 'figure-of-three' shadow as in the previous case The article is illustrated with numerous diagrams and radiographs to show the application of the suture

A NEW TREATMENT FOR CHRONIC LEUCORRHOEA

BY

ALECK BOURNE, M A, M.B., F.R C S, F.C.O.G
Obstetric Surgeon to St Mary's and Southend General Hospitals

L. T. BOND, M.A., M B., B.Ch.
Pathologist to the Southend General Hospital

AND

K. A. McGARRITY, M B., B.S.
Obstetric Registrar, Southend General Hospital

(WITH SPECIAL PLATE)

So long as the cause of leucorrhoea may be uncertain or, in some cases, unknown its treatment must be empirical Whether the excessive mucus secretion of the cervix is due to an increase from structurally normal glands, under the stimulus of chronic inflammation, or to an endocrine disturbance the only method of arresting the discharge which at present has a good chance of success is by destruction of the whole mucous membrane of the cervical canal

Earlier Methods

At first treatment was chemical By the application of strong antiseptic substances such as iodized phenol picric acid, formalin, or acriflavine in glycerin an attempt was made to kill the offending microbe Incidentally, we may mention that up to the last few years the great majority of all leucorrhoeal discharges were regarded as due to infection of the cervix But even if this is so a cursory examination of the histology of the cervical mucosa will show how impossible it is to kill an infection buried deeply in the recesses of its branched glands unless at the same time the tissue itself is destroyed This is obvious clinically by the failure in so many cases to effect the slightest improvement, even after many applications of chemical agents A later method of treatment was an attempt to kill the organism by diathermy or ionization A certain measure of success attended these efforts, especially in the case of erosions of the cervix but in general the leucorrhoea arising from the cervical canal after perhaps a temporary improvement is left unaffected

Recently some workers have aimed at the actual destruction of the gland-bearing mucous membrane by the diathermy cutting curette or the electro cautery (Ainsworth Davis, 1934) If all, or nearly all, the glands are destroyed a clinical cure will follow, but though some results are conspicuously successful objections are that it is necessary to operate under anaesthesia, and that the cutting curette may cause a serious haemorrhage about ten days after operation Further, it is not easy to strip the canal evenly not too deeply and yet sufficiently to ensure the destruction of all the mucosa

Preliminary Trials with Zinc Chloride

After having been disappointed by the various methods of treating leucorrhoea it occurred to one of us that if the whole mucosa of the cervix could be destroyed by the application of a chemical agent, without the necessity of an anaesthetic, there would be a prospect of a real and permanent cure The substance chosen was a saturated solution of zinc chloride in water The immediate difficulty in the early trials was to find a suitable vehicle by which it could be introduced and removed from the cervix without the danger of too large a dose, and of its con-

when he was given 50 units a day and he complained that he felt ill with it It was eventually reduced to 24 units daily with which the blood sugar remained at 0 24 to 0 29 gram per 100 c cm , and he felt better

I saw him later in deep coma the blood sugar gradually rose from 0 38 to 0.95 gram per 100 c cm coma persisted in spite of 260 units of insulin and he died in twenty four hours A necropsy was done, which showed that the thyroid contained an adenoma undergoing toxic changes The brain showed scattered areas of recent softening and the islet tissue of the pancreas varying degrees of hyaline degeneration up to complete destruction

In this case there were probably multiple causes giving rise to the disease, and I would regard it as one in which both the nervous system and the thyroid combined to produce over-mobilization, throwing an ever increasing strain on the islet tissue I had considered the advisability of thyroidectomy and now regret that the normal basal metabolic rate dissuaded me from calling in a surgeon Occasionally a gross organic lesion of the brain may be responsible for glycosuria I have twice seen cases of encephalitis lethargica in which the glycosuria was at first the predominant feature and on one occasion a diabetes of long standing appeared to be associated with a *temporo sphenoidal tumour*

The nervous element is therefore a very real one and it explains the rapid deterioration in diabetics who have been subjected to nervous strain Probably the beneficial effects from opium and codeine seen in the former treatment of diabetes were due to their inhibition of a nervous mobilization

Diminished Storage Capacity

A diminished capacity to store owing to lack of insulin is undoubtedly the commonest cause of diabetes and is found especially in the diabetes of children and young adults Here the age of the patient alters the clinical appearances In the young patient growth dominates the picture, the ductless glands especially the pituitary are in full activity, mobilization is rapid acetone as well as sugar appears in the urine early in the case and there is no history of obesity Usually the response to insulin is good, but owing to the rapidity of mobilization stabilization may be difficult and the patient will pass from hyperglycaemia to hypoglycaemia in a few hours In older patients, where growth has ceased and especially where sexual maturity has been passed the disease is not so rapid Acetone appears later, and there is often a history of a rapid increase of obesity for one or two years prior to the onset of the disease, followed by an equally rapid fall

It would seem that there has been time for a compensatory mechanism to function, and the increased carbohydrate has been stored as fat This history I regard as almost pathognomonic of a pancreatic type of diabetes, and the case almost invariably responds to insulin The appearance of these pancreatic patients also is often characteristic and the brick-coloured cheeks on a yellow tinged background are in themselves a clear call for the immediate use of insulin It is the pancreatic type of diabetes, too, in which acetonuria is so common and the great danger is from a direct disturbance of metabolism ending in coma On the other hand, complications such as cataract true carbuncle and gangrene are comparatively rare Even if the disease occurs later in life and there are repeated attacks of coma the patient usually escapes them

Liver Disturbance

Many varieties of liver disturbance appear to be responsible for a glycosuria Haemochromatosis is one of the more obvious and by no means rare causes It occurs only in men, and a bronzed tinge of the skin combined with an enlarged liver is always suspicious Here liver pancreas and muscles are all involved so that it is difficult to assess the responsibility of one particular organ but the poor response to insulin is evidence that factors other than the pancreas are concerned In one case an enlarged hard liver had been noted seven years before the onset of glycosuria, which suggested that a hepatic disturbance was the primary condition

Glycosuria too *is commonly* associated with a cholecystitis Usually it is mild in type and responds to diet alone and often it clears up completely after the gall bladder has been removed Although the appearance of sugar is usually attributed to an associated pancreatitis insulin is rarely either necessary or advisable and it has been pointed out that while in pancreatitis the head of the organ is chiefly involved the bulk of the islet tissue is in the tail

The glycosuria of extreme obesity often found in beer drinkers is probably entirely hepatic It responds well to diet and I believe is wholly due to an excessive deposit of fat in the liver

The glycosuria of gout is also probably associated with the liver disturbance It is usually of mild type and in my experience does not respond to insulin Thus a man who is now 60 has been under my observation for the past ten years he is liable to occasional attacks of gout and has had sugar intermittently for twenty years The family history is remarkable six out of eight brothers and sisters have glycosuria but all have reached the age of 60 or over He did not respond well to insulin and with 40 units a day did not become sugar free and there was no clinical improvement For a time he took 5 units daily, but the blood sugar was high (a fasting level of 0 312 gram per 100 c cm) For the last six months however he has taken no insulin at all and the fasting blood sugar has dropped to 0 231 gram per 100 c cm and he says he feels better without it

Acute liver disease associated with diabetes is very rare but recently I saw a case in which it appeared to be undoubted A man aged 40 who had passed as a first class life for insurance two years before, developed a severe lobar pneumonia Two days later jaundice appeared and sugar was found in the urine When I saw him in consultation he was intensely jaundiced the liver was palpable, and the blood sugar 0 336 gram per 100 c cm As we thought the case was hepatic rather than pancreatic he was given glucose and only a moderate dose of insulin 10 units twice a day The pneumonia cleared up by lysis and the temperature was normal six days later, the jaundice also disappeared the urine became sugar free and the insulin was then stopped The last blood sugar was 0 129 gram per 100 c cm one and a quarter hours after a mixed meal and he was then taking an ordinary diet and apparently in perfect health

Diabetes and Pernicious Anaemia

The association of diabetes mellitus with pernicious anaemia is a well recognized although not very common condition Here we seem to be on surer ground for in pernicious anaemia we have a disease which is definitely cured by liver therapy and when this has been achieved the diabetes mellitus may clear up completely It is important to bear the association in mind or serious consequences may ensue

Thus in March 1935 I was asked to see a woman of 40 who had been taking 15 units of insulin twice a day for the past six months She was very ill and although sugar-free she was convinced that the insulin

menstruation, and three are no better Of the eleven cases four still showed an unhealed cervix and three were found to have large and unhealed erosions Another reason for failure which we have occasionally noted is subacute or chronic vaginitis, which may maintain leucorrhoea almost indefinitely if untreated

Pathology of the Cervix after Treatment

An important point which obviously arises in the consideration of a drastic treatment of the cervical mucosa is the question of re-epithelialization of the canal after the mucosa has been discharged as a slough If a new epithelium fails to grow the canal would be lined by granulation tissue, which would not only maintain a discharge but also would ultimately cause stenosis by contraction of its scar tissue, but if the denuded canal becomes lined again by epithelium there will be no danger of stenosis or discharge from chronic granulation tissue In order to study this point and other histological changes in the cervix after the application of zinc chloride, pencils were inserted in the cervix of more than twenty women, chiefly cases of fibroids, on whom it had been decided to perform hysterectomy for various reasons The time of insertion of the pencil before the operation was so arranged as to provide material for study varying from an hour to several weeks after the application of zinc chloride

In assessing the microscopical findings in these cases it must be remembered that by no means all of them were suffering from endocervicitis The changes observed, therefore, do not always show the reaction of infected cervical mucosa, but simply the reorganization of the average cervical canal before and after the discharge of the slough The earliest specimens were obtained four hours after treatment The mucosa is dull grey, and transverse section shows a clearly defined greyish-white zone around the lumen from two to four millimetres deep (Fig 1, Special Plate) From the necrotic appearance of the zone it was anticipated that the typical signs of necrosis would be found microscopically, but in point of fact the histological appearances in these areas are those of perfectly fixed and preserved tissue both before and after the discharge of the slough due to the fixative action of zinc chloride The only abnormal feature seen in the necrotic area is dilatation and thrombosis of the blood vessels Indeed, this is the only indication in the most recent specimens of the depth to which the zinc has penetrated (Fig 2)

In the tissue deep to the zone a series of changes rapidly begins After four or five hours the vessels are dilated and large numbers of leucocytes are already to be seen in the tissue spaces (Fig 3), while a sharp line of demarcation occurs at the periphery of the zinc-affected area, which becomes more obvious as the inflammatory exudate becomes denser (Fig 4) Between the two zones just described there is also a third narrow zone of coagulation necrosis, into which the inflammatory cells do not penetrate and which does not show the histological features as well as those of the zinc zone which will subsequently form the slough It is along this line that the slough will eventually separate

The area of necrosis usually includes the majority but not all of the cervical glands An occasional gland is deep enough for its fundus to escape the necrosing action of the zinc chloride (see Fig 1), and it is chiefly from these remaining islets of epithelium that the new lining of the canal is developed after the slough has separated In a few examples all the glands appeared to have been removed, and in these the canal was apparently relined by squamous epithelium extending from the external o The depth of necrosis also varies in accordance with t closeness of contact of the pencil with the mucosa I the pencil has been too small to fill or even distend t canal transverse section shows the line of demarcat failing to encircle the lumen completely It will come to the surface in one area leaving some glands entir unaffected This is particularly noticed where the cervi is patulous, deeply torn, or the cross section of the canal shows a serpiginous outline

During the first week there are the usual signs of i intense inflammation along the edge of the necrotic zo Towards the end of the week there is an increase necrosis of the narrow zone along the periphery of th slough, preparatory to its separation The main mass is discharged about a week after the application of the pencil Sometimes it is found intact as a complete tubular cast of the cervical canal About the tenth day the cervical canal is lined with exuberant granulation tissue deeply infiltrated with acute and chronic inflammatory cells, including numbers of plasma cells (Fig 5), and containing some of the fundi of the deeper glands which open into the new canal At this early stage the canal is already beginning to close down, and the first signs of epithelialization can been seen After two weeks there is very little bare granulation tissue remaining, for almost the whole canal has been covered by epithelium growing out from the gland remnants, at first this extends from the glands as a single layer of flattened cells which rapidly multiply and heap up to form a layer many cells thick, resembling squamous or transitional epithelium (Fig 6), and by the end of the third week the canal and even some of the more superficial glands are almost entirely lined by this squamous type of epithelium, while only the deepest glands retain the normal columnar cells As the new epithelium develops so the inflammatory reaction in the subjacent tissues diminishes and finally disappears During the third and fourth weeks the final stage in the relining of the canal begins, in the superficial layers of cells vacuoles appear, which coalesce to form vesicles (Fig 7) by rupture of the vesicles the roofing cells are thrown off in masses, leaving a single layer of columnar cells, which was originally the basal layer of the squamous epithelium This process continues until about the sixth week, by which time the canal is almost completely lined by columnar cells (Fig 8) At first these cells show an exuberant growth in the form of tree like folds, resembling small papillomata, but by the end of the seventh week the irregularities have all disappeared, leaving an even regular layer of columnar epithelium It is of interest to note that one cervix examined eight and a half weeks after the application of zinc chloride showed the greater part of the canal still covered only with granulation tissue The only epithelial lining was found close to the external os as an extension of squamous epithelium from the portio vaginalis, and in this specimen no gland remnants could be seen In another case examined twelve weeks after treatment the entire canal was lined with squamous epithelium, and here again there was a complete absence of glands It seems that re-epithelialization from the external os is a much slower process than when it is developed from surviving fragments of the glands

It is possible to correlate the pathological processes and clinical progress The first action of zinc chloride is to produce thrombosis of the mucosal vessels and rapid necrosis for a depth of about three millimetres A glandular secretion therefore stops and the vagina is found to be almost completely dry for about three days Tra

of insulin twice daily The blood sugar fell to 0 162 and then to 0 081 gram per 100 c cm later it returned to 0 25 gram per 100 c.cm and remained about this figure for six weeks With insulin discontinued but the diet kept the same the blood sugar seven days later was 0 286 and fourteen days later 0 304 gram per 100 c cm Two months later the fasting blood sugar was 0 19 gram per 100 c cm

This patient later went to India, and the last I heard of her was a rather indignant letter from her doctor asking why insulin had been discontinued, and by the next mail an urgent message from her husband asking for instructions, as a determined attempt to get her sugar free was making her very ill

In this case as in many others, insulin did produce a temporary reduction of blood sugar but this was followed later by a rise to a higher level than before she came under treatment Evidently the effect of insulin had been to increase storage for a time until the warehouses had reached the limit of their capacity, when the blood sugar returned to its old level

Other Considerations

I could quote many such instances in which arterio sclerosis retinitis or cataract has often been the principal feature, and bearing in mind the success of liver therapy in the cases associated with pernicious anaemia I have used it on them too, and believe I have seen a clinical improvement although I have not been able to demonstrate any marked fall in the blood sugar level Before leaving this matter I would refer to the subject of arterio sclerotic heart disease and particularly to coronary thrombosis Here a moderate glycosuria is common, and lowering of the blood sugar either by carbohydrate starvation or by insulin undoubtedly aggravates the disease Any reduction of the blood sugar level to the region of 0 1 gram per 100 c cm gives rise to symptoms of vague ill health and the optimum figure may be two or three times the normal It is in these cases particularly that insulin must be used with great caution and if we blindly try to achieve a laboratory ideal there is a grave risk of sudden death Race too, has an important bearing and the arteriosclerotic type is often seen in Jews

Diabetes mellitus often appears in the Jewish race, but the cases are nearly always past middle life and the acute pancreatic type with acetonuria is very uncommon Usually the disease itself is mild, and they first come under observation for cataract, retinitis or hyperpiesis rather than for glycosuria The response to insulin is variable and so a cautious prognosis should be given Even when diabetes does occur in the young Jew its clinical picture and response to insulin differ from those of the young Gentile, in whom a dramatic onset and a dramatic response to treatment is the rule so that we can only conclude that the aetiology is entirely different

The following case will illustrate my meaning

A girl of 12 first consulted her doctor complaining of blueness and coldness of the legs and glycosuria was discovered in the course of routine examination Apart from a little thirst there were none of the usual symptoms of diabetes there was no loss of weight and her general health was good The family history was suggestive The mother had had a mild diabetes for many years and an aunt and cousin suffered from Raynaud's disease The fasting blood sugar was 0 285 gram per 100 c cm and with 5 units of insulin twice a day it fell to 0 128 but gradually rose again and later was 0 346 gram per 100 c cm on 15 units twice a day There has never been any acetone nor has the child had any of the hypoglycaemic attacks which so commonly affect non Jewish children When I saw her a few days ago she had stopped the insulin of her own accord The fasting blood sugar was 0 212 gram per 100 c cm, and she said she felt better without it

Here the presence of Raynaud's disease in both the patient and her aunt and the poor response to insulin strongly suggest a peripheral rather than a pancreatic cause

Conclusion

The classification I have suggested is unorthodox and will have to be modified considerably as time goes on for it is certain that other factors the sex organs in particular enter into the production of glycosuria At present however our knowledge of them is so meagre that they cannot yet be considered

Some of my conclusions however I do not think will have to be modified

First—That glycosuria is a symptom and not an entity and each particular case must be studied to find the primary disturbance

Secondly—The optimum blood sugar level may not coincide with the so called normal blood sugar level

Thirdly—The criterion of successful treatment is not the achievement of a laboratory ideal the rationale of which we do not fully understand but whether the patient does or does not show a clinical improvement

DIRECT BRONCHOSCOPIC INVESTIGATION IN HAEMOPTYSIS WITHOUT PHYSICAL OR RADIOLOGICAL MANIFESTATIONS

BY

JOHN E G McGIBBON, M B, B S, D L O
Honorary Laryngologist Royal Southern Hospital Liverpool

AND

E T BAKER-BATES, M D, M R C P
Honorary Assistant Physician Royal Southern Hospital Liverpool

(From the Bronchoscopic Clinic Royal Southern Hospital)

(WITH SPECIAL PLATE)

Etymologically haemoptysis denotes spitting of blood but the term has become by general usage commonly restricted to the expectoration of blood originating from that portion of the respiratory tract situated below the vocal cords In certain cases of haemoptysis there is not infrequently a lack of signs on complete clinical examination and direct or contrast radiological study so that it is impossible by these means to ascertain the cause or source of the bleeding It is to such cases that the following notes refer

The significance of haemoptysis as a sign of serious pulmonary disease has been long recognized and it is impossible and unnecessary in this short article to enumerate in detail the many causes of this accident. It is a matter of experience however that in a large proportion of cases haemoptysis is caused by pulmonary tuberculosis and it is not surprising therefore to note in the older literature the great significance accorded to blood-spitting in the diagnosis of this disease Commonly the majority of patients who spat blood were regarded as cases of pulmonary tuberculosis and many correctly so diagnosed succumbed to the disease the remainder either died as the result of an unrecognized causative lesion or lived an invidious existence under the stigma of consumption

scybala with flatus, gave a little relief It was decided, in spite of the previous attack of obstinate constipation on March 21, to withhold aperients and solid food by mouth Hot poultices, four hourly enemata, and belladonna were ordered When seen again in the evening she was reported to have had a fairly comfortable day The pain had diminished, and was now a constant ache in the left loin There had been nausea but no vomiting and flatus had been passed The pulse, which was 104 in the morning, had dropped to 96, and there was no rise of temperature The abdomen was soft, with no local tenderness or rigidity or palpable mass Next morning, May 8, at 9 30 a m , the condition had changed a little for the worse The temperature was still normal and the pulse 100 , there was nausea and retching without vomiting, and the pain was still an ache in the left iliac fossa and not very troublesome There was a very little general distension of a soft abdomen, with a sensation of a mass without tenderness or rigidity in the left iliac fossa The tongue was a little dry and the expression rather drawn and anxious, though she had slept at intervals and expressed herself as feeling better than on the previous day No flatus had been passed during the night Two turpentine enemata at half-hourly intervals were now ordered, each preceded by 1/2 c cm of pituitrin , each returned unchanged, without force and without faeces or flatus Intestinal obstruction, which had been suspected from the first but seemed to be negatived by the improvement in the condition the previous afternoon, now seemed fairly obvious, and immediate operation was arranged

Operation

I opened the abdomen by a mid line subumbilical incision at 11 45 a m on May 8, with a tentative but fairly confident diagnosis of acute following chronic intestinal obstruction due to a growth in the distal colon At first it looked as if a serious error had been made The intestine, large and small, was collapsed, and no growth was palpable along the colon On lifting the gut out of the pelvis the true state of affairs was revealed when a loop of tense, distended, plum coloured gut was found bound down in the pouch of Douglas by a tight band in the region of the right broad ligament It was impossible to deliver the gut through the opening into which it had passed until the band had been divided between clamps The band was a flat ribbon, a quarter of an inch thick and one inch deep from above downwards , the outer end was adherent just below the pelvic brim , the inner end was continuous with the broad ligament The band formed the upper boundary of a circular opening about three quarters of an inch in diameter, the other boundaries being the peritoneum of the outer pelvic wall externally and the thickened edge of the broad ligament below and to the inner side The atrophic ovary was a small nodule of fibrous tissue below and internal to this ring The Fallopian tube was not recognizable as an anatomical entity The strangulated gut was a loop eight inches in length about eighteen inches from the ileo-caecal valve Withdrawn from its hernia, the usual doubt as to viability arose peristalsis and colour returned slowly after hot saline compresses had been applied for five minutes There were haemorrhages into the oedematous mesentery, and patches of a grey colour at each end of the loop where the actual strangulation had occurred At this stage the pulse became imperceptible and as resection would have meant death on the table the patches of threatening necrosis at each end were oversewn and the abdomen closed, leaving the strangulated loop immediately under the peritoneum with a rubber glove drain leading down to it The operation lasted twenty five minutes During the afternoon the patient's condition improved considerably , pain ceased, vomiting did not recur and flatus was passed Intravenous gum-arabic-saline glucose infusion with *B welchii* and *B coli* serum with cardiac stimulation led to such improvement in the general condition that the outlook towards evening seemed fairly good but at 2 30 a m the patient somewhat suddenly collapsed and died A post mortem was not asked for, but there was nothing to suggest that perforation and peritonitis had occurred rather the immediate improvement suggested that death was due to exhaustion in an old lady already seriously debilitated by so many other disorders

Commentary

The case has been set out in some detail as it did quite illustrate the classical clinical features of intest strangulation Small intestinal strangulation is said to cause acute, persistent, and increasing pain at onset, with marked collapse and persistent vomiting through the usual stages from stomach contents to fae material Here the pain was intermittent and never severe, collapse was almost entirely absent, and vomi occurred only at the onset and did not persist Dur the afternoon there was definite improvement, with a f in the pulse rate and passage of flatus The absen distension was a very striking feature on opening abdomen The earlier attack of constipation may h been due to the passage of a loop of gut through t hernial ring, but it is difficult to see how such a co dition could have undergone spontaneous reduction, equally difficult to believe that the obstruction could h been incomplete at first so as to lead to the amelior of the symptoms during the first eight hours As t actual causation of the band, it is possible that the fimbriated end of the Fallopian tube had at some date become adherent to the peritoneum lining th wall of pelvis prolapse of the uterus must have on these adhesions and intestinal movements have moulded the adherent tube into a band, leaving an opening belov Possibly the insertion of the pessary had in some way been the exciting cause of the passage of bowel through the ring, though there was an interval of three days between the two events

---

N Danbolt (*Tidsskr norske Laegeforen* , November 1 and 15, 1936, pp 1161 and 1225) defines lues congenit tarda as a condition developing after years of latency childhood, adolescence, or even adult life Although prophylactic treatment of syphilis during pregnancy been supposed to have been well established in Oslo s 1920, Professor Danbolt has observed as many as s six cases of lues congenita tarda at the Rikshospital d the past five years There were twenty-four boys young men and forty-two girls and young women in this material In most cases the more pronounced mani festations of the disease appeared just before or durin puberty There were eight cases in which the first mani festations appeared before the seventh year and ten cas in which they did not appear till after the nineteenth year Parenchymatous keratitis was the first manifesta tion in as many as thirty-seven cases, and there were altogether fifty-one cases in which disease of the eyes developed at some time or other Indeed, disease of th eyes was the predominant manifestation of syphilis in th material Syphilis of the bones and joints was the fir manifestation in six cases, and in six other cases it mad its first appearance in the skin or mucous membranes There were seven cases in which syphilitic disease of th central nervous system was the first warning Hutchinson's teeth were found in twenty cases and defective hearin in five In many cases the patients were already so old that reliable information could not be obtained about their mothers during pregnancy , but the examination o thirty mothers showed that seventeen of them had been ignorant of their infection and had received no specific treatment for it, and that the remaining thirteen, though aware of their disease and given specific treatment, had not received any during their pregnancies It will thus be seen that nothing effective had been done in th cases to prevent the congenital syphilis during pregnancy and the lesson of this study is that even in a civilized community at the present time there is wholesale neglec of elementary precautions against the development of con genital syphilis

obvious source of the haemoptysis as the remainder of the visible bronchial tree appeared to be normal

In an article published since these notes were written Gerlings (1936) has described three cases of tracheal and bronchial venectasies and he has recorded a comprehensive list of references to this condition most of which are Continental His conclusions are that the only clinical sign of the lesion is sudden profuse haemoptysis accompanied by coughing which occurs independently of exertion and which is prone to recur though the amount of blood lost is not usually dangerous to life It would appear from his observations that the condition occurs most often in people of middle age, that the site of predilection of the varicosity is on the anterior tracheal wall just below the vocal cord, although it may be situated anywhere in the trachea or bronchi, and that it may vary in character from a diffuse mucosal hyperaemia to a definite varix

Chronic Non specific Granuloma

There was one case of haemoptysis due to a chronic inflammatory lesion in the present series

Case II—A female aged 56 complained of a slight dry cough for some months During the five weeks preceding examination she had coughed up blood on four occasions and at the last attack she had spat up a large quantity—at least two kidney-dishes full—of bright red blood There were no physical signs of pulmonary disease and repeated direct x ray examinations disclosed no x ray evidence of bronchial carcinoma or any other radiological abnormality X ray after the instillation of lipiodol showed a normal bronchogram The blood Wassermann reaction was negative and the sputum was negative for tubercle bacilli

Bronchoscopic examination revealed a half ring of granulation tissue on the lateral wall of the right main bronchus immediately below its junction with the upper lobe bronchus (Fig 2 Special Plate) This was not causing any bronchial obstruction and it was thought to be a chronic inflammatory manifestation No treatment was instituted and the patient had no further haemoptysis Three months later she was readmitted for further bronchoscopic examination in order to confirm the diagnosis of non malignancy A proprietary local anaesthetic was used instead of the usual 2½ per cent cocaine with adrenaline and during the administration the patient collapsed and died before any bronchoscopic examination was undertaken Apparently she had an idiosyncrasy to the particular drug used

The aetiology of this inflammatory lesion was undetermined but that it resolved spontaneously became obvious as Professor Dible who performed a necropsy found no abnormality of the bronchi

Non specific granulomata of the tracheo bronchial tree have been fully discussed by the Jacksons (1932) who have described several cases, and they state that although the aetiology is undetermined in most of them there is evidence of inflammation as a secondary if not primary factor The granulomatous masses may be either sessile or pedunculated although the former predominate they vary in size from that of a granule to that of a large pedunculated tumour and the tissue occasionally is present at more than one site in the bronchi Although ulceration does occur this is relatively rare in comparison with true neoplasms, which they resemble in appearance but the fixity and rigidity of the bronchial wall observed bronchoscopically in the neighbourhood of carcinomatous growths is absent with simple granulomata These observers state that the early signs of simple granuloma of the bronchi are haemoptysis and a wheeze heard at the open mouth and they are of the opinion that a correct diagnosis can be made only by bronchoscopy

Innocent New Growths

One patient of the present series who had an innocent neoplasm of the bronchus complained of long standing recurrent haemoptyses and in spite of repeated investigations in various hospitals and sanatoria only once were any physical or radiological signs of a pulmonary lesion detected

Case III—A male aged 22 complained of a cough which had been present for nine years and of recurrent haemoptyses over a period of six years Physical and radiological signs of pulmonary disease were absent except immediately after one attack of bleeding when there was shown radiologically a transient collapse of the left lower lobe secondary to occlusion of the bronchus by blood The radiological findings are of interest and are given in detail.

January 2 1932 Normal
August 26 1932 Normal
June 12 1933 Partial collapse of left lung falling in of left side of chest mediastinum displaced Indefinite shadow at left root ? tumour pressing on bronchus These changes have taken place since previous x ray *ten months* ago"
June 23 1933 Condition has apparently improved—the heart and mediastinum are not so displaced as at the previous x ray
September 1 1933 Normal
December 16 1933 Normal
December 17 1933 Lipiodol bronchography— No abnormality shown

The sputum was negative for tubercle bacilli and the blood Wassermann reaction was negative

December 22 1935 Bronchoscopy disclosed a sessile tumour of the anterior wall of the left lower bronchus immediately above its terminal divisions (Fig 3 Special Plate) The tumour was of very hard consistency and a specimen removed was reported by Dr R Mole to be a fibroma arising from bronchus Eight 1·5 millicurie radon seeds were inserted into the growth

There was no further haemorrhage for seven months when the patient had a profuse haemoptysis A further bronchoscopic examination showed the tumour to be reduced to about half its original size The remaining mass was treated by diathermy

Chevalier Jackson (1934b) has written of benign tumours that all the common types seen elsewhere may occur in the trachea and bronchi, and that their early symptoms may be so slight as to escape notice Two symptoms however are almost always present—namely wheezing heard at the open mouth and haemoptysis Morlock and Pinchin (1935) have reported nine cases of simple new growth in a series of 120 cases of bronchial neoplasm—that is in 6 per cent of their cases From their observations adenoma would appear to be the most common simple new growth followed closely in frequency by fibroma and Gerlings (1936) has reported thirty four cases of adenoma out of fifty one cases of innocent bronchial new growths Morlock and Pinchin (1935) emphasize the fact that the first symptom of such growths is frequently haemoptysis which may recur They agree with the findings of Wessler and Rabin (1932) who have stated that the haemoptysis is of a definite characteristic type—for example sudden onset unaccompanied by other symptoms of pulmonary or bronchial disease abrupt cessation and absence of subsequent staining of the sputum In one of the cases reported haemoptysis had been the only symptom for twenty years

In these cases of non malignant new growths bronchoscopy would appear to be the only means of diagnosis and in a review of the cases published up to a few years ago it was stated that careful search of the literature reveals that as the only cases of benign neoplasm of the bronchus diagnosed except post mortem were diagnosed

Reviews

RISKS OF MECHANIZED LIFE

Accidents and Their Prevention By H M Vernon, M A, M D (Pp 336, 61 figures 15s net) London Cambridge University Press 1936

No purely negative appeal can touch a progressive people nor can reason divorced from emotion inspire them Dr H M Vernon deals with this dilemma at the beginning of his book and decides that the slogan "Safety First" while capable of being interpreted negatively can most certainly be regarded and taught positively He deals convincingly with the theme that creative living is impossible if we do not handle our dangerous modern equipment with proper care This book is a fully documented survey of the whole field of accidental civil hazards, and it is interesting and easy to read It sheds a wealth of light into many obscure corners and shows up clearly the danger spots in our modern mechanized life Among fatalities the two chief causes are road accidents (39 per cent) and burns and scalds in the home (9 per cent), which latter are equivalent to those caused in all the factories, mines, and quarries added together This points to the urgent need for better domestic safety devices to protect young children In industry it is estimated that accidents cost about £30,000,000 a year, of which 18 per cent is compensation cost and 82 per cent "hidden" or indirect cost, though this takes no account of the losses sustained in the family by reason of the workers' incapacity It would not seem unreasonable to double the figure in reaching the full estimate

The chapter on accident proneness is well done and very fair, and the perplexed layman will find in it a description of tests which should remove many difficulties It is still common to find intelligent people unable to distinguish between something which tests a faculty directly in the manner of Snellen's type and a procedure which, though measurable, gives estimates of other apparently unrelated faculties only by correlation or inference This is discussed simply and with admirable clarity General sickness and accident susceptibility are shown in close relationship to one another, but it is a pity that while the excess of accidents to juveniles in industry is brought out there is no mention of the recent rate of increase In 1928, in every 100,000 workers, juveniles had an excess of accidents over adults of 3 per cent, in 1935 it was 22 per cent The correlation with increased working hours would be an interesting one to determine Fatigue is shown to be far less potent as a cause of accidents than is alcohol, but it is not quite clear that the author has sufficiently analysed his fatigue data Much of the fatigue may be really boredom, which one would not expect to be so dangerous as a true physiological fatigue with a refractory period and consequent loss of accuracy

Ventilating and heating engineers would do well to consider the effect of air temperature on the accident rate High temperatures induce greater fatigue and more accidents, but excessive cold has ill effects too Bad lighting and high speeds at work lead to an increase in eye injuries particularly does defective lighting cause the worker to get too close to his job and thus lead to more foreign bodies in the eyes In dealing with motor cars Dr Vernon gives a well-deserved criticism of the failure of designers to consider the physiology and posture of the driver Too often the field of vision is unduly obscured So too in industry—machines are often designed so that reaching and stretching are inevitable Controls should be placed to meet the needs of those who will use the machines Young workers and women suffer much in this respect

The high ratio of fatal to non-fatal accidents in the building trade (1 to 25) shows how dangerous is this work and how dreadfully careless many contractors are The mania of people to get the roof on before the foundations are finished and to occupy a building before it is half complete leads to rush and to the neglect of proper care This question of hurried contract work might have been investigated, though it is hardly fair to the author to find him further tasks in a field he has otherwise covered with such skill and painstaking care The figures given for accidents in respect of lifting tackle add point to the criticism of rushed and hurried work Railways are dismissed with honour, and it is obviously safer to travel by rail than by any other means, although the air seems safer than the road

The whole question of safety education and safety organization is handled in a practical manner Industrial first-aid arrangements come in for criticism Sepsis is increasing, and it is obvious that much first aid work is poorly done Rush and tear in any concern leave little time for proper attention, and in any works of reasonable size a properly trained nurse ought to have the duty of taking charge of every accident, however trivial An increased accident rate, provided that the severity rate is falling, need not of itself cause alarm if in fact it is due to a greater percentage of the accidents being reported and properly cared for Many other points could be quoted which would make the basis for a good education campaign The education, however, must not be confined to the worker, nor even to the employer, though his duty is a heavy one Architects, designers, and engineers must do their share, but society at large must determine how fast it wants to go in industry, on the roads, in the mines, and even in the home There is a point beyond which the price is not worth paying and we seem to have reached it It is not only physical pace but mental pace The author makes it clear that the environment, both physical and emotional, in which any work is done determines in a large measure the degree of safety (and, be it added, the degree of accuracy and efficiency) with which it is accomplished

Dr Vernon has written a first-class book which, if properly studied, should contribute very largely to the safety and happiness of workers in many spheres and to those who travel It is the busy administrator who needs this book most, and it is admirably suited to the man who wishes to gather facts and data in a hurry To those with more leisure and a mathematical mind there is a wealth of additional information to be extracted from the tables If Dr Vernon cares to pursue the matter a very interesting sequel might be written round the correlation between accidents, sickness, and general social and economic tendencies—a controversial subject, but well worth investigating

A SURVEY OF SURGICAL PRACTICE

Textbook of General Surgery By Warren H Cole M D F A C S, and Robert Elman, M D (Pp 1,031 figures 40s net) New York and London D Appleton Century Co 1936

This work is dedicated by its authors to Dr Evarts A Graham, who points out in a foreword that the book is the outcome of a course which has for some years been given to junior students of the Washington University School of Medicine The object of the course has been to present to the students a systematic survey of the whole field of surgery This object the authors may be

to cause pain to the patient The type of bronchoscope which has been found to be of most service by the present writers is of special design, and it will be described elsewhere

Diagnostic and therapeutic bronchoscopy demand unselfish team work and close co operation between the physician, bronchoscopist, and radiologist for in spite of the great value of this method of investigation there are great difficulties in it becoming readily available outside regular bronchoscopic clinics—a rigid technique a complete set of good instruments trained assistants, and a supply of suitable patients are all necessary

Contraindications

The contraindications for bronchoscopic investigation of cases of haemoptysis of unknown origin are few, and are those dictated by common sense A recent profuse haemorrhage an exsanguinated or moribund patient would naturally contraindicate instrumental intervention Suspected pulmonary tuberculosis is not a contraindication to bronchoscopy but the latter is rarely indicated in this condition However it has probably fallen to the lot of every endoscopist wittingly or unwittingly to examine tuberculous patients with the bronchoscope and Myerson (1934) has reported a series of sixty cases of pulmonary tuberculosis in which routine bronchoscopy was performed without any ill effects Accidents as a direct result of bronchoscopy are rare and Scott Stevenson (1935) has stated that collective statistics show that in 43 710 endoscopies performed by 190 bronchoscopists the mortality was less than 0 1 per cent and that if one considers the bronchoscopy apart from the condition for which it was done there is no mortality—that is no death occurred from the mere insertion of the bronchoscope One death in the series reported above was due to an anaesthetic idiosyncrasy, and took place before the operation was begun

Summary

Six cases of haemoptysis of unknown origin are described The causative lesions of the haemorrhage in these cases have been found to be tracheal varix, simple bronchial granuloma, innocent and malignant new growths Doubtless there are many other causes of haemoptysis which do not give rise to clinical or radiological signs such as injury by foreign body, primary tracheal new growths etc , but these we have not encountered

The routine employment of bronchoscopy in such cases is advocated for, as Jackson (1934d) has stated every patient with haemoptysis if not proved tuberculous requires a diagnostic bronchoscopy—there is no need therefore to lay down any special list of indications

Bronchoscopy which is a safe and harmless method of investigation, affords the only possible means of making an early and positive diagnosis in cases of bronchial neoplasm yet its value is not yet generally appreciated and diagnosis is apt to be based on the inferential evidence of physical signs x ray examinations etc all of which may be misleading or entirely negative. Looper (1933) summarized these observations when he wrote that in a review of the literature on the subject one is impressed by the great amount of attention which has been devoted to the study of clinical symptoms, signs pathological reports and x ray observations all of which offer little definite help in making a positive diagnosis whereas bronchoscopy is the most important and most accurate aid of all but is given scant recognition unless the article is by a specialist in the field

There is no risk involved in advising a patient to undergo this method of investigation—on the contrary much is to be gained A differential diagnosis is urgent and essential in regard to prognosis and treatment as from the patient's point of view all bronchial neoplasms are malignant whether histologically so or not in that eventually they will give rise to complications which if left untreated usually prove fatal Furthermore if any successful treatment by surgery radium or x rays can be evolved for bronchial carcinoma its success will depend on the earliest possible diagnosis The physician therefore should be prepared to look and see and not be content to wait and see as in the experience of the present writers the wait may be long before there is manifest clinical or radiological evidence of malignancy by which time all hope of curative therapy will have passed

Our acknowledgements are due to our colleague who have generously allowed us to examine and treat their patients and particularly to Dr J H Mather and his staff for the many valuable radiological opinions and excellent x ray films without which it would have been impossible to record these notes

J H Zaaijer (*Zbl Chir* November 14 1936 p 2714) condemns the coagulation of the prostate by means of diathermy Instead he advises non-coagulation diathermy applied to the prostate by means of a special sonde This is a sonde coude made of ebonite with an active metal electrode of 17 5 mm at the concave side of the bend The position of the sonde is controlled by means of a finger inserted into the rectum 0 5 to 0 6 ampere is applied for one half to one minute (in certain cases up to three minutes) Five to six treatments usually suffice for a cure but occasionally as many as fifteen to twenty treatments may be required The treatment does not cause coagulation of the prostate only shrinking It is not meant to replace prostatectomy It should be applied only in cases where spontaneous micturition is impossible while the patients are too ill for a radical operation The author has treated 100 cases with this method Spontaneous micturition was re-established in eighty five cases In seven cases the treatment failed (one case proved to be a carcinoma of the prostate) and seven patients died from different causes during the course of treatment In fifty three out of the eighty five successful cases the cure was permanent In cases of recurrence the course of treatment can be repeated

omitted Not only does over-condensation frequently give a false impression of the process described, but the student is further misled by some actually untrue statements—for example (page 27), that macrophages ingest damaged cells "but do not touch bacteria"

It is a little difficult to adopt the point of view of the elementary student, and he may perhaps gain more from this book than appears likely at first sight, but while it is quite certain that he will still have nine-tenths of his subject to learn after reading it, there is a danger that he may have something to unlearn as well It should be added that the publishers have circulated a letter to recipients of review copies stating that acknowledgements made in the foreword to four other pathologists for help in preparing the book imply no responsibility on their part for its contents

VASCULAR CHANNELS OF THE SKULL

A Roentgenographic Study of the Vascular Channels of the Skull With Special Reference to Intracranial Tumors and Arterio venous Aneurysms By Knut Lindblom *Acta Radiologica Supplementum XXX* (Pp 146, 154 figures 10 Swedish Crowns net) Stockholm P A Norstedt und Soner 1936

The importance to a surgeon of knowing how to interpret a radiograph of the skull is well borne out by Knut Lindblom's monograph with this title The first part of the book gives a detailed account of the measurements of the vascular groves and foramina in the normal skull, and the remaining two-thirds deals with the variations associated with intracranial tumours and arterio-venous aneurysms The work is splendidly illustrated with numerous skiagrams and drawings, and should be carefully read by all radiologists and neurologists

Dr Lindblom has had the advantage of collaborating with his colleagues in the departments of anatomy and pathology, and Professors Antoni and Olivecrona have provided the carefully worked-out clinical material which forms the outstanding feature of the book The only tumour of the brain which produces any alteration in the vascular markings on the bone is Lindau's tumour of the cerebellum, but changes of diagnostic value, which are well shown in the pictures, occur with the majority of meningiomas, though it is strange that the bone should be more frequently involved in certain situations It is also interesting to note how often widening of the foramina for the occipital emissary veins is associated with long-standing increase in intracranial pressure The monograph is an excellent example of the benefit to be derived from intelligent co-operation between several specialists interested in the same problem

Notes on Books

The Southend General Hospital is to be congratulated on its enterprise in producing *Contributions to Clinical Practice in Medicine and Surgery* a collective work by members of the staff under the editorship of Dr T ROWLAND HILL one of the physicians As Dr Hill states in the preface it is intended that this volume shall be followed by a series of similar publications under the auspices of the hospital The book is composed of original articles from all the departments, thus covering a wide clinical field Among the twenty-four contributions are many of interest to the general practitioner—for example the fracture problem nasal deformities, and oral sepsis in relation to health Others deal with unusual conditions such as proptosis following arterio-venous aneurysm hereditary haemorrhagic telangiectasia, and pericanalicular fibro-adenoma of the male breast In addition to the senior members of the staff the medical and surgical registrars and the first house-surgeon are also among the contributors The book, which extends to more than two hundred pages, is remarkable for the quantity and quality of its illustrations Copies may be obtained from H K Lewis and Co (136, Gower Street, W C 1) or through any bookseller, price 12s 6d

Dr R CAMPBELL THOMPSON'S *Dictionary of Assyrian Chemistry and Geology* (H Milford, Oxford University Press, 21s) contains much information of historical interest to medical readers Mentioned under the heading, "The Drugs from the River" are black and yellow sulphur, bitumen, and gypsum The Tigris has several sulphur springs on its banks, and there are also sulphur mines eight miles from Mosul Sulphur was used in fumigation, primarily to drive away evil spirits It was also used, as nowadays, for scabies, and for many other conditions, such as "lichens on the face and leprosy, morphew, and nits in the hair" Bitumen, described by Pomet as stercus diaboli, still floats on the water near Hammam Ali This has a high sulphur content, and was indeed regarded as black sulphur Gypsum, "the white bank of the river," was employed internally for urinary troubles and menorrhagia Reference is also made to various forms of arsenic The book contains information on the ancient methods of pounding and crushing stones and glass, and the glass receipts of the seventh century B C It is primarily a work for Assyriologists

The thirteenth edition of Dr THOMAS LATHROP STEDMAN'S *Practical Medical Dictionary* (London Baillière, Tindall and Cox, 35s) reaches us less than three years after we published a notice of the twelfth With this issue the work celebrates its twenty-fifth anniversary having been first offered to the medical and scientific public in 1911 Work in preparation for the original edition occupied three years Numerous changes have been made on this occasion to secure uniformity with the eleventh edition of the *United States Pharmacopoeia* and the sixth of the *U S National Formulary*, including the adoption of "the chemists' spelling of sulfur and the sulfur compounds with an *f* in place of the more familiar *ph*" Dr Stedman has not thought it advisable to incorporate in the body of his dictionary the new terminology proposed by a committee of the Anatomical Society of Great Britain and Ireland by way of revision of the Basle Anatomical Nomenclature, an appendix, however, gives the equivalents of these words in terms of the B N A

The thirteenth edition of *Halliburton's Essentials of Chemical Physiology* (Longmans, Green and Co, 9s) appears under the editorship of Dr J A HEWITT and Dr W ROBSON, thus continuing the long association with King's College, London The text is no longer divided into elementary and advanced sections and the section on organic chemistry has been deleted, thus allowing some new matter to be added without increasing the size of the book

The eighty-ninth issue of *Who's Who*, for the year 1937, follows the style of its predecessors in format, typography, and general arrangement Some 40,000 compact biographies of living men and women are included, and they occupy 3,722 double-column pages Deletions and new entries balance each other in number, and many thousands of existing entries have been brought up to date It is evident that the editorial staff are unremitting in the care they exercise during the annual revision of this valuable reference book, and the outcome of their labours does credit to the publishing house of A and C Black Ltd The current edition of *Who's Who* has become part of the apparatus of modern life in this country and no newspaper office or large business firm or social institution can do without it The price remains at 60s in buckram, or 63s in leather-backed binding

cessful cases have been reported by Freiberg Ask Wright Rycroft and others Colonel Kirwan of Calcutta has performed a number of these operations in India with good results basing his procedure on my technique but modifying it in certain ways The results of three surgeons who have published a report of all their cases, and my own results will now be discussed

ELSCHNIG

Professor Dr Elschnig of Prague published an account of 174 operations 139 of these were apparently on suitable eyes and he obtained thirty two clear grafts and thirty three partially clear grafts fifty one were opaque and twenty three grafts became detached thirty-five operations were on unfavourable eyes and of these two grafts were clear, six partially clear and the results of the remaining twenty seven were described as unfavourable no details being given as to the number of grafts lost etc By Elschnig's technique—which follows largely on the technique of Von Hippel—it appears that 46 per cent of grafts on suitable eyes were successful—in the sense of being clear or partially clear but 16 per cent of the grafts became detached His best results were in a group of twenty-six cases of corneal opacity following interstitial keratitis in which 73 per cent were either clear or partially clear and only one graft was lost

FILATOV

Professor V P Filatov published an account of ninety six operations Forty eight of these were on thirty eight unfavourable eyes and he reports no successes but gives no further details The remaining forty eight operations were on suitable eyes and he divides these into two groups The first group consists of twenty two operations on corneae completely opaque one graft was clear and seven grafts showed much opacity but less than the original corneal opacity The second group consists of twenty six operations on corneae not completely opaque In this group thirteen grafts were described as successful From the details given it appears that ten were clear two showed slight opacity, and one showed much opacity but less than the original corneal opacity Filatov's technique is based largely on Elschnig's technique and it appears that 43 per cent of grafts on suitable eyes were successful in the sense of being clear or partially clear Details are not available as to the number of grafts lost In cases of interstitial keratitis his successes were 66 per cent

CASTROVIEJO

R Castroviejo published a summary of thirty-two operations on twenty seven eyes, and divided them into two groups The first group consisted of eleven operations on corneae where the opacity was not complete and not dense Nine of the grafts were clear or partially clear and one eye was lost The second group consisted of twenty one operations on unfavourable eyes in which were included those where the cornea was completely or densely opaque One of the grafts was clear but had a membrane behind it, seven grafts were clear Castroviejo has accepted the principle of preparing the graft and the hole in the recipient cornea with shelving margins (which was established in my animal experimental work) and has elaborated his own technique utilizing a rectangular graft in place of the round graft which I employ Some of the eyes which he includes in the group of unfavourable cases should in my view, be included in the group of favourable cases or in a subdivision of that group I refer particularly to cases where the unfavourable factor is simply the extent or density of the corneal opacity This makes it difficult to compare his results with those of other surgeons and in future publications if the scheme suggested in this paper were adopted it would greatly facilitate the comparison In a group of nine cases where details are given it appears that in four suitable eyes three were successful one graft on a suitable eye in an unfavourable patient resulted in loss of the eye four grafts on unfavourable eyes resulted in one clear graft and two partially clear It appears that 50 per cent of the thirty two operations were successful, and in the group of cases described as favourable 81 per cent. were successful

TUDOR THOMAS

The period covered by this summary of my results is from my first operation over five and a half years ago to the thirty sixth operation three and a half months ago The technique employed had been elaborated by experimental work from 1922 and was described in its relation to the operation on man at the Oxford Ophthalmological Congress in 1935 The results of the thirty six operations are given in accordance with the scheme suggested in this paper

Results of Corneal Transplantation

Results of 36 Operations on 32 eyes		Group A	Group B	Group C	
		Suitable Eyes		Unfavourable Eyes	
		In favourable patients	In unfavourable patients	(a) Extraocular Conditions	(b) Intraocular Conditions
Successes	Group 1 Clinically transparent	5	0	0	0
	Group 2 Slight degree of opacity in or behind graft	6 (15 = 83 per cent.)	1 3	0 1	0 2
	Group 3 Much opacity but less than original corneal opacity	4	2	1	2
Failures	Group 4 Much opacity Equal to or worse than original opacity	2	2	5	7
	Group 5 Graft detached	0 3	0 2	0 5	1 5
	Group 6 Eye lost	0	0	0	0

Case I—One of my cases in Group A was a patient (see Special Plate Figs 1 and 2) whose vision was improved by operation from fingers at two feet to 6/12 and 6/9 partly She is able to read the smallest print her graft is transparent and the fundus of the eye is easily and clearly seen She has practically a full field of vision and is able to carry on an independent existence This is my best result and the best result so far obtained in this country her vision being restored practically to normal In several of my cases the fundus is visible by ophthalmoscopic examination

Case II—Another case in Group A was a patient (see Special Plate Figs 3 and 4) whose vision was improved from hand movements to 6/36 Her corneae were previously completely opaque She was demonstrated recently to the Bristol Medico Chirurgical Society Her graft is transparent and her vision would be much better if it were not for a slight degree of old standing opacity in the lens She had been unable to see her way about for ten years but can now get about alone and has read many books (See also Figs 5 6 and 7)

Commentary

One primary object in corneal transplantation is that the graft should unite and the loss of twenty three grafts in Elschnig's 139 suitable eyes a loss of one in six contrasted with the fact that my eighteen grafts on suitable eyes all became united confirms me in my belief that the principle of cutting the graft shelving which was determined in my experimental work can be applied with advantage to the operation on man because the operation performed by Elschnig differs from my own procedure essentially although not solely in that regard In

persons of either sex even when they are of age The scheme also provides for special training in venereology in the medical curriculum, and no drug for the treatment of venereal disease is to be sold or employed in a public institution unless it is acceptable to the public health authorities who will also refuse to recognize the serological tests of laboratories which are not officially approved It will be seen from this summary that M Sellier's scheme is a bold blow not only against the white slave traffic but also against quackery It is still too early to form an estimate of the reaction of the medical profession to this scheme The delicate question concerning professional secrecy may chill the potential enthusiasm of some doctors for it On the other hand, the clauses aiming at the discouragement of the quack and his remedies will be greeted by the medical profession with unreserved satisfaction

HEALTH IN THE SUDAN

The report on the Sudan Medical Service for 1935 is a most informative document, provided with an index and an excellent map The medical administration of this vast area is carried out by a mere handful of British officials Apart from administrative officers and specialists, there are only thirty-three medical inspectors and fifteen sanitary inspectors These are assisted by a much larger staff of Sudanese, who have now almost entirely replaced Syrians in the subordinate positions There are, in addition, a few mission hospitals, staffed by one or more British doctors Considering climatic and other conditions, the health of British officials in the Sudan is exceptionally good During the year under review, of 798 officials only one died and only three were invalided, while the average days' sickness per head was 1 32 These figures reflect credit on the Sudan Medical Service, though they are doubtless partially attributable to the generous leave regulations in force The incidence of small-pox is remarkably low in the Sudan Twenty-eight cases of mild type were reported from the Wau district and the only severe cases three in number occurred among pilgrims returning from Mecca Rabies is increasing and is now endemic in all parts excepting two districts of the Northern Province Ten human cases were reported Hyenas, jackals and stray dogs form a reservoir of infection impossible to eradicate while infection may be spread by the Arab sheep-dogs, whose nomadic masters traverse wide stretches of country During the year 3 249 cases of cerebro-spinal meningitis with 2,154 deaths were reported As in 1934, there was a severe outbreak in the Kordofan Province The usual therapeutic measures proved of little avail, but the experimental administration of vitamin A extract as a prophylactic showed favourable, though inconclusive, results Reliance was chiefly placed on such general measures as propaganda evacuation of villages and quarantine In one instance where every precaution had been taken and the roads from an infected district had been picketed a further outbreak was started in a fresh area through one man evading the police cordon Experience has shown that the onset of the rainy season causes a temporary cessation of an epidemic If a village has suffered heavily before the rains it is usually free during the next dry season, if only a few cases have occurred the second outbreak is often severe Among the Sudanese attention has been paid to midwifery and child welfare even in rural districts, while the subnutrition of the natives especially prevalent in Southern Kordofan is being combated by the planting of fruit and vegetable gardens The sanitary control of aircraft becomes increasingly important All machines entering and leaving the Sudan are inspected and disinsectized The number of these mosquito inspections for the year was 1 394

ARACHNIDISM

Some time ago we commented[1] on the habits of the "black widow" spider one of the more unpleasant inhabitants of the Southern States of America and many other warm countries She is so called because she devours her husband she is a coal black glossy insect about half an inch long with a span of between one and two inches and a globular abdomen bearing on its under side a bright red spot usually in the shape of an hourglass The male is rather larger and has the same abdominal markings, and also a row of orange spots down the middle of the back three orange stripes on his side, and straw coloured bands on his legs These spiders live in dark and dry places very often near dwellings The web is irregular and characteristic, for its threads criss-cross at various angles and in many different planes The bite is poisonous and most of the cases occur in the late summer and autumn when the spiders are most numerous Dr A S Hargiss contributes in a recent paper some more valuable information on this pest and the results of its bite[2] The toxin seems to stimulate the myoneural junction or to act on the nerve endings There is no lasting immunity and serotherapy has been disappointing The symptoms are startling and dramatic The patient rolls and tosses about the bed in intense agony and may cry out at times The pain may be lancinating, cramping, aching or constricting and sometimes comes and goes It spreads slowly from the place of the bite until the poison reaches the general circulation, and then it spreads rapidly to all the large muscle groups One of the best accounts is the personal experience of Blair[3] Some patients have profuse cold perspiration subnormal temperature, difficulty in breathing, restlessness, anxiety, and other symptoms common to acute medical or surgical emergencies There is board-like rigidity of the abdomen, intercostal muscles and muscles of the back The extremities are spastic and the reflexes are generally hyperactive, localized tenderness is uncommon The most important part of the differential diagnosis is from an acute intra-abdominal lesion The mortality is low—2 or 3 per cent Treatment is empirical and the method recommended by Dr Hargiss comprises hypodermic injections of 1/4 grain of morphine sulphate repeated as often as may be necessary intramuscular calcium gluconate intravenous glucose a hot bath for an hour or more plenty of blankets kept warm with a radiant light copious fluids and thorough elimination

taminating and so burning the vagina At first the salt was mixed with flour and kaolin and later resin and olive oil But all these bougies were unsatisfactory They were difficult to introduce, and still more difficult to remove at the end of the treatment

Finally porous clay pencils were used in four sizes 1¼ inches long and of different diameters If these pencils are placed in a saturated solution of zinc chloride for ten minutes they will become fully charged with the salt and ready for use In most cases there is no difficulty in inserting one of a suitable size without pain and it is easy to remove by the wire passed through a hole drilled in the proximal end of the pencil The absorption of zinc chloride by the tissues is fairly constant according to the size of the pencil and the duration of the application, and it is sufficient to produce necrosis of the mucosa extending about two to four millimetres deep

If the dose of zinc has been insufficient, either because too small a pencil has been used or because the time of application is too short the zone of necrosis will be uneven or not deep enough to affect all the glands, and partial failure will follow while on the other hand if the dose has been excessive necrosis may penetrate too deeply In these cases a large slough representing a cast of the major part of the cervix, tunnelled by its canal may separate about the seventh day, but even though so much tissue has been removed we have never seen anything more than very slight bleeding at the time of separation and in one or two cases after removal and examination by the microscope, the canal was found to be of normal size and lined by epithelium

Reasons for Failure

There are three chief reasons for failure The dose of zinc chloride in quantity and time may be too small so that the depth of necrosis is not enough to reach the deepest parts of the glands If too much glandular epithelium is left untouched by the zinc new glands will arise and the amount of mucus will be as great as before A second possibility is that the cervical canal is not circular in section but may be irregular so that the round clay pencil while distending part of the canal may leave some recesses unoccupied In this case those parts of the canal which have not been in contact with the pencil will be unaffected, and a source of persisting leucorrhoea A third difficulty is the deeply lacerated everted cervix of the multipara Here the canal is shaped like an inverted funnel and it cannot hold the pencil in close contact with its walls A very large erosion too will not be destroyed but we have found that small erosions may disappear after treatment of the canal

Indications and Advantages

The type of cervix which is most suitable for treatment by zinc chloride is the one which has not been deeply lacerated and is therefore able to hold the pencil in close contact with its wall throughout its whole length In a few cases if there is a large erosion it is necessary to give a general anaesthetic to allow its treatment by the electric cautery after which the pencil may be inserted into the canal Anaesthesia may also be necessary for a few patients who cannot tolerate a speculum or any vaginal manipulation

The advantages of this method of treatment are that usually anaesthesia is not necessary the pencil is easy to introduce there is no discomfort during the time it is in position only one application is necessary, and the results are almost uniformly good

TECHNIQUE

The patient is placed in the left lateral or dorsal position and a Sims speculum is introduced into the vagina In a good light and with the aid of a spatula to lift the antero-vaginal wall forward it is usually possible to obtain complete exposure of the cervix and external os The area is swabbed clean and the anterior lip of the cervix is gently grasped by a single toothed vulsellum Some women feel a little pain as the tissue is pierced by the teeth of the vulsellum but if it is too much the instrument may be discarded

Meanwhile each of the four sizes of clay pencil has been soaking in a saturated solution of zinc chloride for ten minutes According to the apparent size of the external os a pencil of suitable diameter is taken by a ring forceps and passed into the cervix which is steadied by the vulsellum until its proximal end is flush with the external os or even just beyond it The pencil should fit accurately into the cervical canal and therefore if the size chosen passes too easily it should be removed and a larger size inserted We have found that the most convenient size is No 3 (1¼ inches by 1/4 inch) which has been used in 70 per cent of our cases It is sometimes necessary to use a certain amount of pressure to ensure that the pencil is completely embedded in the cervical canal for it is most important that the proximal end should not project from the os If it is not wholly contained in the canal it is very liable to drop out into the vagina A strip of gauze moistened with a 5 per cent solution of sodium bicarbonate is loosely packed around the cervix and firmly against the os to maintain the pencil in position Sodium bicarbonate is used to neutralize any zinc chloride solution which might spill into the vagina and cause a burn Where the pencil fits well into the cervix there is little chance of damage to the vagina but if it has been impossible to insert it completely the bicarbonate solution in gauze is an essential precaution The instruments are removed and the patient lies quietly for a period varying from two to four hours No 4 pencil remains for two hours No 3 for three hours and No 2 for four hours At the end of this time the gauze pack is removed and the pencil is withdrawn by means of the wire attached to its base and projecting from the vagina No further treatment is necessary

The subsequent clinical course is as follows For two or three days there is no discharge whatever this is due to the complete necrosis of the mucous membrane which has not yet begun to separate as a slough About the third or fourth day it reappears and increases until the sixth or seventh day, when a little blood is usually noticed This corresponds to the separation of the necrotic mucosa as a slough either in one well defined grey mass or in the form of small particles and shreds For a few days there is a profuse sero purulent discharge which gradually diminishes during the next four weeks until finally there is nothing more than the normal moisture of the vagina Occasionally it has ceased in a fortnight while other patients have complained of it for six or eight weeks Examination of the cervix through a speculum after two months even if a large slough has been passed, in a successful case will reveal no abnormality

Results

During the past two years we have re examined forty-one of the women we treated for profuse leucorrhoea Certain others who had been treated failed to return for examination and have not been included in this review

Of the forty one questioned and examined we may fairly report that twenty seven can be regarded as cured inasmuch as they stated that they were not conscious of white discharge and by inspection of the undouched vagina no abnormal mucus or pus could be seen Eleven women admitted considerable improvement but were still conscious of some leucorrhoea, especially in relation to

of mucus reappear, which become mixed with serum, and then a little blood as the slough separates towards the end of the first week. The subsequent granulation tissue exudes a little serum which gradually diminishes and finally disappears as the process of epithelialization is complete. The final cure which we have noted in a large proportion of the cases is due to the great reduction in the numbers and lengths of the glands.

Note by A. C. Adamson

Pharmacist, Southend-on-Sea General Hospital

The applicators are made from a clay such as is used for the manufacture of filter candles. They are tapered to facilitate insertion and have a terminal hole for the attachment of the wire by which they are withdrawn. Tinned copper fuse wire (30 ampere) has been found most satisfactory. The following sizes have been used:

Size	Length	Diameter
1	1 inch	3/16 inch
2	1¼	3/16
3	1¼	1/4
4	1¼	5/16

Before use each applicator is immersed in a solution of zinc chloride (1 in 1 (a few drops of hydrochloric acid dissolves any oxychloride that may be present). The amount of the salt absorbed by the pencils during ten minutes' immersion is nearly constant for each size of applicator. I have estimated five of each size and find only a slight variation in the content of zinc chloride. The following is an average of the results:

Size	
1	absorbed solution equivalent to 2·34 grains zinc chloride
2	2·73
3	4·29
4	6·6

A number of applicators were collected after use and the remaining zinc chloride estimated:

Size	Size of Applicator	Amount of zinc chloride absorbed by tissue	Per cent
1	1 in. × 3/16 in.	—	—
2	1¼ in. × 3/16 in.	2·13 grains	78
3	1¼ in. × 1/4 in.	3·39	79
4	1¼ in. × 5/16 in.	5·23	79

The applicators were made to specification by Messrs. A. Gallenkamp and Co., Ltd., and are also available from Messrs. Allen and Hanburys, Ltd.

Summary

We have described a method of treatment of chronic leucorrhoea by destruction of the cervical glands by the necrosing action of zinc chloride. A saturated solution of the salt is applied to the cervical canal by means of a porous clay pencil which has been soaked in the solution for ten minutes. In the majority of cases an anaesthetic is not necessary, for the insertion of the pencil causes little discomfort. A slough of the mucosa is produced and discharged in about a week. A number of sections of the cervix have been made at varying intervals after application of zinc chloride which have demonstrated the complete re-epithelialization of the canal. The results to date show that of forty-one cases treated and examined afterwards twenty-seven are completely cured, eleven are definitely improved, and three are no better.

ADHERENT FALLOPIAN TUBE CAUSING INTESTINAL STRANGULATION

BY

F. M. COLLINS, M.B., M.Chir., F.R.C.S.

Major, Indian Medical Service

'Bands formed by anatomical structures abnormally attached' are a well-recognized cause of intestinal strangulation. The commonest abnormality of this nature is an adherent vermiform appendix. In this case it was an adherent Fallopian tube which caused the abdominal catastrophe here described. Without facilities of reference to the literature I am unable to say whether this is a common condition, but as it is unique in my experience and as the preceding and immediate clinical history present unusual features a report of the case seems well worth while.

Case Record

The patient was a married lady of 69. The menopause had taken place at the age of 48. She first came under my care on February 15, 1926, for a complete procedentia uteri. This had been developing for thirty-five years and beyond wearing a ring pessary at intervals no treatment had been sought. When first seen on this date the uterus was protruding two inches outside the vulva and the exposed portions were beginning to ulcerate. The uterus was replaced, a ring pessary inserted and daily douches ordered. Apart from her age there was a moderate rise of blood pressure, a hypertrophied heart and slight albuminuria, all seeming to contraindicate any operative treatment of the prolapse. On February 20 there was a sudden profuse discharge of half a pint of thick yellow pus from the vagina. Vaginal and rectal examination failed to disclose any disease in the uterine appendages that might be the origin of this purulent discharge, which in the absence of other causes was assumed to be intra-uterine in origin. The pessary was removed and treatment with douches, ichthyol tampons and later with intra-uterine instillations of iodine in glycerin were tried. On March 10 the patient began to complain of frequency of micturition and burning. The urine, besides the usual trace of albumin, now contained a few pus and epithelial cells and was strongly acid; culture revealed a *B. coli* infection. Treatment by alkalis for ten days followed by acidification and hexamine and a course of autogenous vaccine injections cleared this up in four weeks; it is probable that there was an ascending urethral infection which had caused a mild cystitis.

The purulent vaginal discharge continued intermittently; for a few days there would be none and then several ounces would discharge unexpectedly. Repeated vaginal examination and inspection was still negative and though pus could never be demonstrated coming from the cervical canal the trouble was thought to be a pyometra and on March 18 dilatation and curettage was carried out and the previous treatment with douches, tampons and instillations continued. There after the discharge gradually cleared up and from April 20 was absent. On May 3 she was examined and all traces of infection seemed to have gone; by then the cystitis too had cleared up so the ring pessary was reinserted. During all this time there had been obstinate constipation which failed to yield to dietetic measures and paraffin preparations and for which daily doses of senna or cascara had been required. She was said to be subject to visceroptosis and on March 21 there had occurred an attack of severe abdominal pain of a colicky nature with vomiting which had lasted all day and had been relieved only when the third turpentine enema preceded by pituitrin had brought away a large faecal accumulation. The pessary inserted on May 3 controlled the prolapse satisfactorily and on May 6 the patient was convalescent in a chair.

On May 7 I saw her at 10 a.m. and was told that she had been in severe pain for two hours; the pain was of sudden onset, colicky in nature, occurring in spasms every ten to fifteen minutes. An enema which brought away some

THE SCIENTIFIC WORK OF THE ASSOCIATION

The scientific activities of the British Medical Association fall into two main groups, one comprising the work performed at Headquarters through the medium of central committees, and the other representing facilities provided by the Association for the pursuit of research by individuals or for the promotion of interest in the different branches of medicine A third type of activity, consisting of collective investigations, has been attempted, but for various reasons it has lately been discontinued In addition there are of course the frequent scientific and clinical meetings arranged for the local profession by the Divisions and Branches

Special committees on scientific subjects have always been a prominent feature of the Association's work, and their investigations have often resulted in valuable contributions to knowledge of the subjects under review The investigations these committees have made cover a wide field, ranging from purely scientific questions, such as the medical aspects of abortion, to topics of great social interest, such as nutrition The Association is pre eminently suited to be the organizer of investigations which require the collaboration of medical men drawn from all types of practice, of organizations of various kinds, and, on occasion, of lay persons, and the lists of the personnel of its special committees contain the names of individuals of the highest repute in their respective spheres of work

Early Investigations

The first of the extensive inquiries undertaken by the Association was a series of investigations into the use of chloroform A committee appointed in 1877 had considered the source of the special danger of chloroform, and in 1888 the Association had granted a sum of money to Professor MacWilliam for research upon the action of this anaesthetic But these and other contemporary inquiries did not lead to the desired result, which was the reduction of the large number of deaths occurring during chloroform anaesthesia, and in 1901 a special Chloroform Committee was appointed to investigate methods of quantitatively determining the presence of chloroform in the air and in the living body, and to determine if possible the minimum dose of the drug that secured an adequate anaesthesia for operations and at the same time did not endanger life The deliberations of this committee continued without intermission until 1910, and it issued, in addition to its final report, a number of interim reports It was generally acknowledged that these reports threw valuable light on the problems connected with chloroform anaesthesia

Another special committee whose work was to have considerable influence on medical practice and on the science of disease was that appointed in 1907, at the instance of the Section of Ophthalmology, to consider the means of preventing ophthalmia neonatorum The committee's report, which was published in 1909, included a recommendation for the compulsory notification of ophthalmia neonatorum In 1914 this policy was actually adopted by the Government, and another recommendation of the committee received practical recognition when the Central Midwives Board altered its rules to include purulent vaginal discharge among the conditions for which a midwife requires medical assistance

Rheumatism and Maternal Mortality

Since the war the work of special scientific committees has increased in volume and importance As illustrations of their contributions to the prevention of illness may be mentioned the investigations of rheumatic heart disease in childhood and of puerperal morbidity and mortality The former was conducted by a subcommittee of the Science Committee under the chairmanship of Sir Humphry Rolleston The subcommittee's first report issued in 1926, considered various aspects of the causation and pathology of rheumatic infection, and its second report, published in the following year, dealt with the means of preventing and controlling the infection As a direct result of the subcommittee's work rheumatic treatment centres were opened in various parts of the country, and several local investigations were instituted The work of the Paddington Green Children's Hospital Centre was assisted by a grant from the Association

The activities of the Association in recent years on the subject of maternal mortality and the preparation of a national maternity service scheme are the result of the labours of a special committee which, during the years 1925 to 1928, considered the causation of puerperal morbidity and mortality This committee, under the chairmanship of Sir Ewen Maclean, based its report on information received from many sources, including individual medical practitioners and the Divisions and Branches of the Association, and it was able to exonerate general practitioners from the charge previously made against them in various quarters that they were largely responsible for the high mortality from puerperal sepsis The committee's recommendations included the provision of adequate ante-natal care, a question which has received very considerable attention lately from central and local authorities

Treatment of Fractures

The organization of facilities for a particular kind of treatment offers an excellent subject for investigation by such a body as the British Medical Association The recent Committee on Fractures, for example, considered from medical and non-medical aspects the existing arrangements for the treatment of fractures and other associated injuries of the limbs and the means of improving those arrangements By collecting from many sources, both medical and lay, information on the various organized and unorganized methods of treatment, and statistics of the duration of disability under each method, it was able to estimate the cost to the community of injuries resulting in fractures, and to submit a scheme for the setting up of fracture clinics throughout the country The committee's report aroused great interest among the profession and the laity A number of fracture clinics have already been established, and the plans of several new hospitals include provision for fully equipped fracture departments The Minister of Health has circulated the medical section of the committee's report to local authorities with a covering letter commending it to their notice, and an Interdepartmental Committee has been appointed "to inquire into the arrangements at present in operation, with a view to the restoration of the working capacity of persons injured by accidents, and to report as to what improvements or developments are desirable and what steps are expedient to give effect thereto, regard being had to the recommendations made in the report issued by the British Medical Association in February, 1935, on 'Fractures'"

Clinical Memoranda

Rupture of Aorta into Duodenum

I was called to a passenger train on June 18 1936 to attend a man who was seriously ill This man was found to be lying on his back in a first-class lavatory with his trousers down in a mass of blood and faeces He was blanched and unconscious and at first sight seemed to be dead He was taken to a waiting room on a stretcher and given a little brandy, which he was able to swallow, and from there to a nursing home, where from documents found in his bag his name and address were ascertained He was seen later in the day in consultation with Mr H H Rayner His wife gave his age as 76 and said that generally he had had good health with no dyspeptic symptoms He had retired from active business but still gave some attention for one day a week to his business interests He had stayed one night at a hotel in a large city but left by an earlier train than usual for his seaside home

Examination showed a large amount of blood in the rectum with clots some of which were passed in bed A pulsating tumour was felt in the epigastrium which Mr Rayner thought might be an abdominal aneurysm Four hours after admission he rallied slightly and his pulse was 124 and temperature 100 8 F He was restless and 1/6 grain of morphine was given every six hours His blood was typed in case transfusion should be thought necessary He improved considerably for two or three days and the haemorrhage seemed to be arrested but he relapsed on June 22 and died early on June 23 Post mortem examination of the abdomen showed the large intestine and part of the small intestine to be filled with blood and clots The duodenum and stomach were examined but there was no evidence of an ulcer The third part of the duodenum was firmly adherent to the aorta In the lumen of this part of the duodenum was a firm ball like clot which was so organized that it was at first mistaken for part of a growth The posterior wall of the duodenum where it was attached to the aorta showed a perforation communicating with the aorta which was very hard and calcareous The third part of the duodenum with a portion of the aorta to which it was adherent was removed and sent to the pathological laboratory of Manchester University

Professor S L Baker examined it and kindly made the following report I think there is little doubt that it is a rupture of a small saccular dilatation of the aorta into the duodenum The aorta shows a very severe calcified atheromatous change Although atheroma is usually confined to the intima of the aorta and does not appreciably weaken its wall yet in this advanced condition one usually finds some thinning and also degenerative changes in the media which on rare occasions result in small localized saccular aneurysms (usually in the abdominal aorta) In this case there appears to be a sac adherent to the duodenum and as there is no visible evidence of inflammatory thickening of the duodenal wall on the edge of the rupture a chronic ulcer is unlikely—and of course an ulcer in this position would be very unusual I suppose that there may well have been a leakage of blood into the duodenum prior to the rupture which might have suggested duodenal ulcer

As already stated there was no history of symptoms of duodenal ulcer but leakage from the aorta may have occurred during the night or early morning while at the hotel This leakage may have caused the patient to feel ill and induced him to take an earlier train than usual On the journey a desire for bowel action made him visit the lavatory and there straining while seated caused rupture resulting in collapse and the condition in which he was found Perforation of the aorta into the duodenum is so rare a condition that it seems worthy of record as cause of bowel haemorrhage resulting in death

I am greatly indebted to Professor S L Baker who has kept the specimen for his interest and report and to Mr H H Rayner for reading the MS

Warrington J S MANSON M D

Angioneurotic Oedema

The following case of angioneurotic oedema occurring on board ship is probably of sufficient interest to warrant reporting

CASE RECORD

A passenger aged 76 went to bed at 11 p m on September 12 feeling quite well About midnight he awoke and found that his tongue was swelling up but he did not send for medical aid until 2 a m By that time he presented a grotesque appearance and it was hard to believe that he was normal three hours before The tongue almost filled the mouth and was protruding between the teeth it was not tender and showed no signs of inflammation Both sides of the neck the submaxillary regions and the lower lip were enormously swollen and tense The patient was unable to articulate but had no serious difficulty in breathing, although he was much troubled by profuse salivation The temperature was 97.2 F and the pulse rate was 90 Fortunately he was accompanied by a son who was able to give the facts of the case There was a history six months previously of a mild swelling of the tongue which had disappeared in a very short time

He was at once removed to the ship's hospital and arrangements were made for laryngotomy should the necessity for it arise Adrenaline 5 minims was injected subcutaneously and thin pieces of ice were given the patient to suck After about half an hour the swelling of the neck and tongue was definitely less tense but meanwhile stridor and respiratory distress had developed An occasional glimpse could be had of the throat which was swollen and oedematous A second injection of adrenaline 7 minims was given subcutaneously and the throat sprayed with the same substance after a dose of magnesium sulphate had been given slowly by mouth

Within an hour he was breathing without serious difficulty He steadily improved and by 8 a m the same day his tongue was almost normal in size The swelling of the neck had disappeared except in the submaxillary regions where it persisted for another three hours During the day 1/2 grain of ephedrine was given by mouth every four hours Forty eight hours after the onset of the attack the parts were quite normal and the patient was in his usual health except that on both arms there was a mild urticarial rash which soon disappeared

There was no previous history of asthma hay fever skin eruptions or any of the complaints usually regarded as being allergic in origin The only departure from the usual diet was a raw peach which the patient had eaten after dinner he had had no gastro intestinal symptoms His blood pressure was 124/64 mm Hg and the urine contained small quantities of albumin and pus this was probably due to an old standing condition as they were still present in about the same quantity three days after recovery

COMMENT

The points of interest in this case are

1 The extremely rapid onset in an elderly person with no definite previous history to suggest liability to such attacks

2 The apparent response to adrenaline

3 The site of the lesion requiring constant supervision of the patient

I wish to express my gratitude to Dr Gardner the senior surgeon whose advice in this case was invaluable

DAVID R HUGHES M B, B Ch
Second Surgeon R M S *Empress of Britain*

pneumonia were some of the subjects investigated in this way In 1927 the method of collective investigation was revived in a somewhat different form, the machinery of the local units of the Association being utilized The subjects chosen for investigation by this method included varicose ulceration, gastro-enterostomy, and the incidence of cancer and its history after treatment

The cost to the Association of its scientific and research work represents an appreciable proportion of its income This work was first arranged on an organized basis with definite financial provision in 1874 and expenditure on it has grown proportionately with the membership and influence of the Association, until in 1929 the Treasurer estimated that at least £35,000 was spent each year directly or indirectly, in the cause of the advancement of science

PROBLEMS IN PRACTICE

(These columns are devoted to matters of general interest on which individual members have sought the advice of the Head Office of the British Medical Association)

CERTIFICATION

A medical practitioner should not issue any certificate without great care and a due sense of the responsibility for the statements of fact or opinion expressed in the certificate The General Medical Council takes a very serious view of any laxity in certification, as will be seen by reference to the warning issued by that body on the subject No certificate regarding a patient under his care should be given by a practitioner to a third party, such as an insurance company or the patient's employer, without the consent of the patient or of the patient's accredited representative Failure to comply with this rule may expose a practitioner to an action for libel No doctor may give to a person who is under the care of an unqualified practitioner a certificate which would have the effect of "covering' the unqualified practitioner

Death Certificates

The Births and Deaths Registration Acts, 1874 and 1926, provide that in the case of the death of any person who has been attended during his last illness by a registered medical practitioner that practitioner shall sign and forthwith deliver (by post or otherwise) to the Registrar of Births and Deaths a certificate stating, to the best of his knowledge and belief the cause of death On signing this certificate the medical practitioner must also give notice, on the prescribed form, of the signing of the death certificate to some person required by the Act to give information concerning the death The persons required by the Act to give information concerning the death are the nearest relatives present at the death or in attendance during the last illness and, in default of such relatives, each person present at the death A fee cannot be claimed giving the certificate A practitioner who has attended deceased in his last illness may give a certificate of death without actually having seen the dead body, but certification of the fact of death by personal observation is always desirable The registrar must report to the coroner (for review and not necessarily for inquest) any death in respect to which it appears to him from the particulars contained in the medical certificate or otherwise that the deceased was not seen by the certifying medical practitioner after death nor within fourteen days before death

In Scotland, though it is customary for the practitioner to hand the certificate of cause of death to some relative of the deceased, the legal obligation is to transmit such certificate to the registrar within seven days after the death If he fails to do so the registrar sends to the practitioner a certificate in blank to be completed and returned within three days under penalty of fine Blank forms of certificate of death may be obtained without charge from the local registrar of births and deaths

Mental Deficiency

Under the Mental Deficiency Acts the parent or guardian of a defective who is an idiot or imbecile and the parent of a defective who though not an idiot or imbecile is under the age of 21, may place him in an institution or under guardianship Certificates in the prescribed form are required from two medical practitioners one of whom must be approved for the purpose by the local authority or by the Board of Control Where the person is under 21 and though mentally defective is not an idiot or imbecile the certificates must be signed also by a judicial authority, after such inquiry as it shall think fit Defectives of any age or any degree of mental defect—that is, whether idiots, imbeciles, feeble minded persons, or moral defectives—may be sent to an institution or placed under guardianship, provided that certain conditions which render them "subject to be dealt with" are fulfilled they may be so dealt with under an order made by a judicial authority on petition or under an order of a court or under an order of the Secretary of State Two medical certificates, as above, must accompany the petition, and an order will not be made unless each medical practitioner who signs the certificate has personally examined the alleged defective within twenty one days before the date of the presentation of the petition Blank forms of certificate may be obtained from any institution which receives patients who are defectives or from the local authority Forms may also be obtained from Messrs Shaw & Sons, Law Stationers, 7, Fetter Lane London, E C 4 The Acts lay down the classes of persons who are deemed to be defectives within the meaning of the Acts and define mental defectiveness to mean a condition of arrested or incomplete development of mind existing before the age of 18 years, whether arising from inherent causes or induced by disease or injury

Sickness Benefit Clubs and Societies

In granting certificates for these purposes the same care should be exercised as in the giving of statutory certificates Even though the practitioner may be well aware of the condition of the patient he should not grant a certificate relative to a particular date without actually having seen the patient on that date

School Children

The onus of proof of a child's unfitness to attend school rests upon the child's parents, and therefore medical practitioners are frequently asked for certificates in this connexion It is essential that in all instances the child should be seen and examined before the certificate is issued, and on no account should a certificate be issued merely upon statements made by a parent or other person

Voluntary Control of Habitual Drunkards

The legal definition of an habitual drunkard is "a person who, not being amenable to any jurisdiction in lunacy, is notwithstanding, by reason of habitual intemperate drinking of intoxicating liquor, at times dangerous

said to have achieved Essentials are dealt with from a modern point of view, if more extensive details of a particular surgical disease are desired by the reader he is given help by a bibliography which is placed at the end of each chapter and brings to his notice some of the more important monographs and recent papers on the subject with which the particular chapter is concerned

In an otherwise excellent survey of the field of modern surgical practice the most disappointing section is that dealing with fractures We do not agree with the statement in the section on the treatment of Colles's fracture that 'the best position [for the hand] is in slight dorsal flexion etc, and it is to be regretted that treatment by the direct application of plaster with the hand ventroflexed is not insisted upon There are a few inaccuracies in the index—for example, Colles's fracture appears as coller fracture and collar fracture—but on the whole the subject matter throughout is well put together The illustrations are particularly good and include shaded and line drawings diagrams, and photographs The inclusion of photographs showing the histology along with pictures of the gross lesion appears to us to be a useful plan and likely to help the student An appendix entitled The Surgical History and Physical Examination is one of the most valuable and important parts of the book, and in a future edition we should like to see it placed at the beginning where it would serve the student as an approach to the main part of the text We believe that this book may be safely recommended to medical students and will make an appeal to them It is likely to prove popular both in the United States and in this country not only among students but also with those practitioners who wish to revise their outlook on the practice of general surgery

SPLENIC PUNCTURE

La Ponction de la Rate By P Émile Weil P Isch Wall and Suzanne Perlès (Pp 148 23 figures 35 fr) Paris Masson et Cie 1936

This concise clearly written and well illustrated monograph by Emile-Weil and co workers coming as it does soon after Dr Everard Napier's report of 5 000 splenic punctures without accident (*Lancet* 1936 2 126) may stimulate English haematologists to make greater use of a method of investigation which has perhaps been too little used in the splenomegalies of temperate climates The reasons for this neglect are doubtless, the relative infrequency of obscure splenic enlargement in non-tropical areas with consequent difficulty in obtaining experience in the technique of puncturing the spleen and interpreting the stained smear, and the fear of danger to the patient from puncturing the spleen in a primary blood disorder This fear appears to be groundless and the French authors have explored the spleen without accident in all forms of leukaemia and in the acute splenic tumour of infections The only formal contraindication to splenic puncture is a haemorrhagic disorder such as haemophilia

The safety of the operation depends on strict adherence to the technique recommended which is much the same as Napier's The essential features are that when the needle is introduced into the spleen only one single swift movement of aspiration is made, the puncture being deliberately a dry one and the smears being made from the small amount of splenic pulp entrapped in the needle The least satisfactory feature of the procedure is the difficulty of getting normal controls because few will feel justified in puncturing a spleen which is healthy and not enlarged The authors have relied on material aspirated at operation from spleens which were being removed on account of thrombocytopenic purpura and there are in addition some data for the normal splenogram in the literature To the haematologist as distinct from the parasitologist and bacteriologist, the great value of the method is in differentiating infiltrative lesions of the spleen such as leukaemia Hodgkin's disease and Gaucher's disease, from other forms of splenomegaly Apparently it gives little or no assistance in separating the different varieties of haemolytic vascular and sclerotic reaction in the spleen The book is very readable the arrangement is lucid and logical and the production of the monograph at a reasonable price does credit to the publishers

MOLECULAR PATHOLOGY OF INFLAMMATION

Die Molekularpathologie der Entzündung By Professor Dr H Schade (Pp 100 20 figures 18 tables RM 9 0) Dresden and Leipzig T Steinkopff

In this book Professor H Schade gives a short but extremely clear and simple exposition of his theories regarding the process of inflammation a subject on which he has conducted researches for the last eleven years His general theory is that the body tissues may be divided into three sections as regards salt and water distribution First the circulating blood secondly the tissue fluids and connective tissue and thirdly the cell protoplasm The capillary wall is freely permeable to water and electrolytes but impermeable to colloids while the cell membrane has a complex and selective permeability The state of swelling of the connective tissue is determined very largely by the reaction of the tissue fluids

The theory of inflammation set forth is that it is initiated by injury to the cells either by mechanical or chemical agents or by bacterial invasion The local consequences of such injuries are an increase in activity a sharp rise of osmotic pressure and a rise of temperature These cause the classical symptoms of inflammation The author's theories are supported by a large mass of careful physical measurements made on clinical cases and on experimental animals In general he succeeds in assigning fairly simple physico chemical causes to most of the phenomena of inflammation and the book summarizes work which constitutes a very interesting contribution to our knowledge of a process of fundamental importance in pathology

ELEMENTARY PATHOLOGY

Elementary Pathology An Introduction to the Process of Disease By Keith S Thompson (Pp 80 9 figures 3 coloured plates 10s 6d net interleaved) London H K Lewis and Co Ltd 1936

The simplest teaching is notoriously the most difficult, and Dr Keith Thompson's attempt to write an introduction to this subject has not overcome the difficulties in this task before which other potential writers have undoubtedly quailed Such a subject cannot be simplified beyond a certain point and over-condensation involves risks of serious omission inadequate explanation, and statement so general as to be untrue or misleading The book contains only 43 pages of letterpress some of these composed of only a few lines the remainder consisting of blank pages for additional notes by the owner, and a number of large photographic illustrations many of which are excellent in themselves but insufficiently described to enable their features to be understood The arrangement of subjects is orthodox in the main but it is not clear why ulceration should have a chapter to itself at the end of the book and the subject of blood transfusion might well have been

Public Health Medical Service

The following changes have recently been made in the public health medical service staffs

Dr F J S Esher to be medical officer of health under the Mental Deficiency Acts for Sheffield

Dr G Fitzgerald to be medical officer of health for County Kerry

Dr G McKim Thomas to be medical officer of health for Cardiff Rural District Council

Dr F R O'Shiel to be medical officer of health for Stepney

Dr A T G Thomas to be medical officer of health for Welwyn Garden City

Dr Patricia Unsworth to be assistant school medical officer for Birkenhead

Dr J H Busteed, medical officer of health for Bungay, is to retire next March

Dr W E Harker is to retire from the post of medical officer of health to the Tyne Port Sanitary Authority, an appointment which he has held for forty-one years

INSURANCE MEDICAL SERVICE WEEK BY WEEK

Retirement of Sir Walter Kinnear

The Ministry of Health suffers a heavy loss by the retirement from the public service on January 1 of Sir Walter S Kinnear, *K B E*, *Controller of the Insurance* Department, and Chief Adviser to the National Health Insurance Joint Committee Sir Walter is, at the Minister of Health's request, continuing to act as Chief Adviser to the Joint Committee, and the Minister has approved the following appointments consequent upon his retirement Mr E Hackforth, C B, to be Controller of the Insurance Department, Mr E G Bearn, C B E, to be Deputy Controller in succession to Mr Hackforth, while continuing to act as Chief Insurance Inspector

When the National Health Insurance Act was passed in *1911 Sir Walter Kinnear was invited by Mr Lloyd George* to become deputy chairman of the Irish National Health Insurance Commission In *1912 he was temporarily* seconded to the National Health Insurance Joint Committee in London to assist in the organization of the new scheme In 1916, when the membership of the English Insurance Commission was seriously depleted, Sir Walter was temporarily assigned, at the request of Sir Robert Morant, to the English Insurance Commission, and acted also as chairman of the Navy, Army, and Air Force Insurance Fund For his services in these capacities during the war he was created K B E in 1918

The Ministry of Health was formed in 1919, and took the powers *and duties of the English* and Welsh ance Commissioners in addition to the work of the al Government Board *Sir Walter was then appointed* the newly created position of the Controller of the Insurance Department of the *Ministry of Health and* Chief Adviser of the National Health Insurance Joint Committee, and he has held these positions for the past seventeen years When the Widows, Orphans', and Old Age Contributory Pensions Act was passed in *1925 Sir* Walter was appointed by the then Minister of Health, Mr Neville Chamberlain, to be Controller of the Joint Health and Pensions Insurance Schemes In that position he has played a prominent part in national insurance legislation for many years

Sir Walter has shown himself a capable and courteous administrator, with a capacity for hard work, a comprehensive knowledge of insurance schemes and a thorough grasp of their essential principles To him must be ascribed much of the credit for the financial stability and efficient organization which have made the British Health and Pensions Insurance Schemes the envy of many other countries At Geneva he has represented Great Britain on insurance questions at many annual conferences of the International Labour Office He has also served on a large number of Government committees including committees on workmen's compensation and unemployment insurance During the past eighteen months he has visited South Africa, Australia New Zealand and British Columbia at the request of the various Dominion and Provincial Governments, in order to assist in the preparation of national insurance schemes

New Edition of "Medical Insurance Practice"

As stated in our notes of last week this book is now in the press and copies will be available at the end of this month The chairman of the Insurance Acts Committee of the British Medical Association has contributed the following foreword to the new edition

"In his foreword to the third edition of this book published in 1909, Dr Dain writing as Chairman of the Insurance Acts Committee, said

"Some standard work of reference is, I am convinced, essential to those, doctors and administrators, who are concerned in the working of Medical Benefit, and it is not too much to say that this book now holds this position and requires little further commendation It has been proved a very present help in many a difficult problem, and, I believe never fails to give the correct answer clearly stated in good plain English The Insurance Acts Committee is so convinced of the usefulness of this book of reference that it has gladly acceded to the *request of the authors to take over the publication of this third* edition in the anticipation that by so doing it can be produced in a form and at a price that will tempt every insurance doctor and lay administrator to possess a copy I hope that all Panel Committees will see to it that the doctors in their areas use this book, and that it continues to be brought to the notice of the younger men as they come into practice'

"I think that it is sufficient for me to say that all that Dr Dain said in recommending the book to practitioners applies with added force to the new edition, and that I regard it as essential that every insurance practitioner should become possessed of a copy of this book With this object in view the National Insurance Defence Trust has authorized its publication at a nominal price"

It is the intention of the Association to bring the publication of this new edition to the notice of every insurance practitioner by means of a brochure, to which is appended a form of application for copies of the book *which is being published at 2s post free*

New Year Reminders

The clerk to the London Insurance Committee, Mr Gilbert, in sending to the practitioners in *London their* cheque for the quarter and New Year's greetings, writes one of his friendly letters, in which he gives once *more* the polite reminders about legibility in writing prescriptions, prompt notification of acceptances, the *transmission* of forms of medical record, and the importance of examining a patient before issuing a certificate Here are two or three points in his informal letter which are *worth* reproducing as being of general interest

Prescriptions—If a deputy acts on your behalf at any time will you please remind him that he should indicate on the prescriptions which he may issue that he is *issuing them on* your behalf, otherwise it is almost impossible satisfactorily to prepare the statistical data *which we are required to*

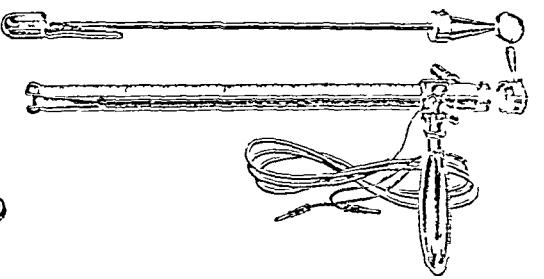
Preparations and Appliances

DIRECTOR FOR STRANGULATED HERNIA

Mr LEONARD LEY (surgeon, Great Yarmouth General Hospital) writes

In operating for strangulated hernia I have found great difficulty in adequately controlling and protecting the intestine by the ordinary winged director when dividing the neck of the sac It occurred to me that if the director had wider wings, and particularly if a deep slot was cut on each side of the grooved director so that the wings could slide down over the neck of the sac the intestine would be completely isolated from the field and unable to slide up and over the director and its wings as it invariably does with the usual director

I wrote to Down Bros Ltd and they have carried out my ideas most meticulously I and my colleagues have since had



several opportunities of testing the instrument and it has fulfilled all my anticipations The accompanying illustration will demonstrate the modifications I have mentioned above

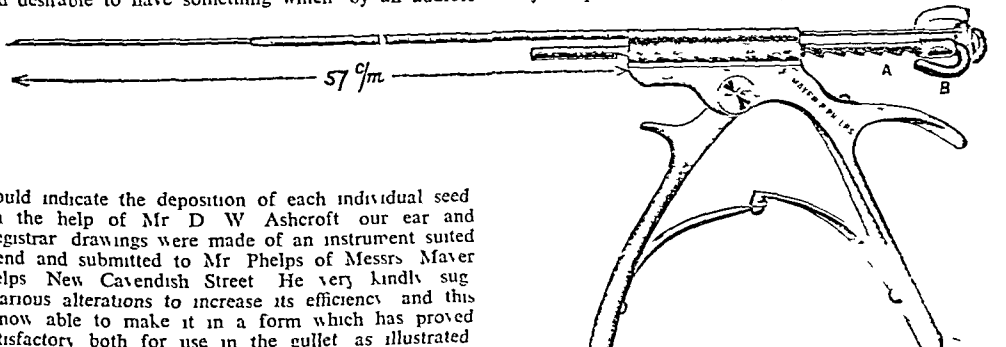
I am grateful to Messrs Down Bros for the care they have taken in carrying out my suggestions

OPERATING SIGMOIDOSCOPE

Dr A DREIFUSS sends the following note from Durban South Africa

The classical sigmoidoscope consists essentially of a metallic tube open at both ends with a handle and equipment for direct illumination and the blowing in of air Simple polypi and adenomata cannot be operatively removed by this form of the sigmoidoscope In the case of polypi which ought to be removed for biopsy or cure an extensive and dangerous operation—for example a modified Kraske —would be necessary There are further indications for the removal of such simple neoplasms In long standing cases of colonic spasm where no other aetiological factor can be found polypi may have a stimulating influence on the neuromuscular apparatus of the bowel This can result in exaggerated peristalsis or in excessive contraction of the sphincter muscles In several such cases I found single polypi and was faced with the problem of their removal without inflicting a major operation on the patient I therefore modified the sigmoidoscope so as to make a simple operation possible A triangular section of the tube with its base at the foremost end of the tube and at its apex a circular hole was removed from that part of the tube opposite to the electric bulb The corresponding piece of metal was attached to the introducer

so that this opening remained covered during the passing in of the instrument This shield is essential to prevent injury of the bowel When the sigmoidoscope is in position and the introducer has been removed the polypus can be brought into the triangular slit and so isolated from the rest of the bowel The removal of the observation end piece for the introduction of operating instruments does not then result in concealing the polypus by the prolapse of part of the bowel wall If the light is obscured the operation can be completed by indirect illumination as in the examination of the middle ear The polypus can be drawn further into the tube by using long crocodile forceps of the ordinary pattern and thus it can be simply removed by cauterization



Using this modified form of the sigmoidoscope it became possible to treat with success a number of cases The modified sigmoidoscope has been made to my design by J Gardner and Son Edinburgh from whom it can be obtained

A NEW RADON-SEED INTRODUCER

Mr F J CLEMINSON (surgeon ear and throat department Middlesex Hospital) writes In carrying out palliative treatment of carcinoma of the gullet by implantation of radon seeds I have never found an entirely satisfactory instrument It seemed desirable to have something which by an audible click, would indicate the deposition of each individual seed So with the help of Mr D W Ashcroft our ear and throat registrar drawings were made of an instrument suited to this end and submitted to Mr Phelps of Messrs Maver and Phelps New Cavendish Street He very kindly suggested various alterations to increase its efficiency and this firm is now able to make it in a form which has proved most satisfactory both for use in the gullet as illustrated and in a shortened form for the bronchi

The seeds are contained by the distal end of the instrument This is sharp and is inserted into the growth via the oesophagoscope for the required distance The handles are then squeezed together and a single seed is deposited this is indicated to the operator by a click By the use of the scale shown in the illustration each seed can be put exactly where the operator wishes until any desired grouping has been obtained

The instrument when fully charged contains ten short Muir seeds each 7 mm long The method of loading is very simple and in brief depends on the turning of the

ratchet R through a half circle by the lever B (see Figure) This disengages the ratchet and allows it to be drawn backward With it moves the stout wire which lies in the lumen of the instrument and pushes out the seeds when the instrument is in action

Katherine Bishop Harman Prize

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman Prize, of the value of £75, in the year 1938. The purpose of the prize, founded in 1926, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child-bearing. It will be awarded for the best essay submitted in open competition, competitors being left free to select the work they wish to present, provided this falls within the scope of the prize. Any medical practitioner registered in the British Empire is eligible to compete.

Should the Council of the Association decide that no essay submitted is of sufficient merit, the prize will not be awarded in 1938, but will be offered again in the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. The decision of the Council will be final.

Each essay must be typewritten or printed in the English language, it must be distinguished by a motto and accompanied by a sealed envelope marked with the same motto and enclosing the candidate's name and address. Essays must be forwarded so as to reach the Medical Secretary (to whom inquiries may be sent), B.M.A. House, Tavistock Square, London, W.C.1, not later than December 31, 1937.

Branch and Division Meetings to be Held

ABERDEEN BRANCH: CITY OF ABERDEEN DIVISION.—At 29, King Street, Aberdeen, Thursday, January 21, 8.30 p.m. B.M.A. Film of World Tour, 1935.

BIRMINGHAM BRANCH.—At Medical Institute, Birmingham, Thursday, January 21, 3.30 p.m. Mr. B. T. Rose: Problems of Diagnosis, Treatment and Prognosis in Cancer of the Breast and Mouth, with Special Reference to Radiotherapy.

BIRMINGHAM BRANCH: WEST BROMWICH AND SMETHWICK DIVISION.—At West Bromwich and District Hospital, Edward Street, West Bromwich, Thursday, January 21, 8.15 p.m. Agenda: Air raid precautions; medical benefit for young adolescents; cellona film dealing with functional treatment of fractures.

DORSET AND WEST HANTS BRANCH: WEST DORSET DIVISION.—At King's Arms Hotel, Dorchester, Wednesday, January 20, 7.30 p.m. Supper, 8.30 p.m., Address on 'The Present Position of Chemical Warfare'.

LANCASHIRE AND CHESHIRE BRANCH: BURNLEY DIVISION.—At Burnley Municipal Hospital, Thursday, January 21. Divisional meeting.

LANCASHIRE AND CHESHIRE BRANCH: SALFORD DIVISION.—At Grand Hotel, Manchester, Thursday, January 21, 8.30 p.m. Reception, 9 p.m. Dinner dance in aid of medical charities.

METROPOLITAN COUNTIES BRANCH: CAMBERWELL DIVISION.—At St. Olaves Hospital, Lower Road, Rotherhithe, S.E., Tuesday January 19, 9 p.m. Mr. J. James: Dental Sepsis and Systemic Disease."

METROPOLITAN COUNTIES BRANCH: FINCHLEY DIVISION.—At Finchley Memorial Hospital, Tuesday, January 19, 8.45 p.m. Major Neville Stafford, R.A.M.C. (ret.): The Role of the General Practitioner in the Air Raid Precautions Scheme.

METROPOLITAN COUNTIES BRANCH: GREENWICH AND DEPTFORD DIVISION.—At Seamen's Hospital, Greenwich, S.E., Tuesday January 19, 9 p.m. Clinical evening.

METROPOLITAN COUNTIES BRANCH: HENDON DIVISION.—Wednesday, January 20. Clinical meeting.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.—At Willesden General Hospital, Wednesday January 20, 9 p.m. Members' own clinical meeting.

NORTH OF ENGLAND BRANCH: NORTHUMBERLAND DIVISION.—At Blue Bell Hotel, Belford, Wednesday January 20, 3 p.m. Dr. F. J. Nattrass (Newcastle upon-Tyne): Points in the Diagnosis of Spinal Diseases.

NORTH OF ENGLAND BRANCH: TYNESIDE DIVISION.—At Tynemouth Infirmary, Tuesday January 19, 8.30 p.m. Consideration of resolutions under the ethical rules of the Division. Address by Mr. W. E. M. Wardill (Newcastle upon Tyne): The After results of Cleft Palate Operations (with gramophone demonstration).

SOUTHERN BRANCH: SOUTHAMPTON DIVISION.—At Royal South Hants and Southampton Hospital, Wednesday, January 20, 8.45 p.m. Mr. Joseph Hawksley, B.Sc., Southampton's Water Supply.

SOUTH-WESTERN BRANCH: EXETER DIVISION.—At Royal Devon and Exeter Hospital, Thursday, January 21, 4 p.m. Annual meeting. Election of officers; consideration of adoption of revision under the ethical rules of the Division, etc.

SURREY BRANCH: KINGSTON-ON-THAMES DIVISION.—At Public Assistance Department, Norbiton, Friday, January 22, 8.30 p.m. Colonel G. Wallace: Air Raid Precautions and Anti-gas Treatment.

SUSSEX BRANCH: BRIGHTON DIVISION.—At Brighton Sanatorium and Fever Hospital, Bear Road, Brighton, Thursday, January 21, 3.45 p.m. Clinical meeting.

YORKSHIRE BRANCH: BRADFORD DIVISION.—At Midland Hotel, Bradford, Wednesday, January 20. Annual Divisional and Charities Dinner-dance.

YORKSHIRE BRANCH: SHEFFIELD DIVISION.—At City General Hospital, Fir Vale, Sheffield, Friday, January 22, 8.30 p.m. Clinical evening. Dr. K. J. G. Milne will show cases of pernicious anæmia treated by anhæmin, and Dr. W. J. Clancy will demonstrate the use of x-ray examination in ante-natal diagnosis.

Meetings of Branches and Divisions

EAST YORKSHIRE BRANCH

At a meeting of the East Yorkshire Branch held at Hull on December 9, 1936, with Dr. S. F. FOURACRE in the chair, Major STUART BLACKMORE gave an address on 'The Medical Aspects of Chemical Warfare'. Major Blackmore said that gases were divided into two main groups, non-persistent and persistent, the latter were really liquids of an oily consistency with low vapour pressure and were dangerous until decontaminated. Gases might also be classed as tear gas, nose gas, lung irritants, and blister gases. As had been demonstrated in Ethiopia, these gases could cause panic in troops and civilian population. Modern respirators protected the nose, mouth, lungs, and digestive system, and could be worn for long periods of time. The persistent gases, however could affect any exposed part of the body, so that a fully protective clothing had to be devised. This consisted of rubber boots, oilskin clothing, and mask.

Tear gases were effective in a concentration of one in a million. They caused discomfort and pain though no serious injury. After removal of the patient from the affected area lavage produced relief. These cases were more of a psychological than a medical problem. Nose gases were really finely divided solids which were not arrested by the activated charcoal in the mask, but by mechanical filters. Nose gases were effective in a concentration of one part in seven millions of air and caused intense burning sensations in the nose, nasal sinuses, mouth, throat and upper chest. Nausea and often mental depression also resulted. There was little pathological damage through exposure to the average concentration of the gas.

The lung irritant groups—represented by phosgene—produced serious pathological results. They caused oedema of the lungs. Patients suffered from anoxæmia, and could be divided into two types—grey and cyanotic. These gases required to be in a concentration of 1 in 10,000 to 1 in 50,000 in order to produce serious results. Hence it was found that there were fewer cases due to these gases as it was more difficult for an enemy to keep up the required concentration. Blister gases were liquid and affected by direct contact or by the vapours slowly arising from the liquid. The liquid was rarely ingested, and so there were few gastro-intestinal cases. Most of the patients showed blistering of the skin and burning of the eyes. The vapour caused a burning effect on the air passages and the lungs as the result of which bacterial invasion occurred with resulting sepsis of the lungs. There was a high mortality in these cases although there were large numbers of minor cases of blistering. The burns resulting from these gases were very difficult to heal as new capillary formation was retarded and sometimes small ulcers took six weeks to heal. It was found by experiment that these gases only attacked living tissues. The eye was most sensitive and 80 per cent. of mustard gas cases showed eye symptoms. The skin was affected next in frequency and the lungs and the mouth to a lesser degree and only occasionally were there any gastro-intestinal cases. The skin reacted in three degrees: erythema, blister and ulcer, and the effect might be arrested at any degree. Lewisite caused a highly raised blister with no areola while mustard gas had a shallow blister and an areola. These gases have lipoid solubility and spread beyond the boundaries of the blister. With the ulcers there is a rapid

asked if the voluntary hospital was all that it might be Were there long waiting lists that pointed to inadequacy of accommodation? Were the out patient activities of the kind demanded? Was the out-patient department used for consultative work or for work within the province of the general practitioner? Did the voluntary hospital open its out-patient doors too wide and thus diminish its efficiency? Were there long cold waits in the out-patient departments? Was the convenience of the working man considered or the convenience of the visiting staff or resident staff? Were there long waits on the telephone before a practitioner could get in touch with a member of the resident staff? Undoubtedly the interests of voluntary hospitals in a few areas were being damaged by practitioners who sent patients to local authority hospitals, but who could blame the practitioner? In many cases all he had to do was to send for the ambulance and the patient got into hospital and into the right department without any hitch Dr Hill believed that the time had come for voluntary hospitals to co ordinate their efforts to give a complete service There must not be undue sentimental affection for the voluntary hospital Above all, it should be efficient, while it was efficient it would survive The public is more concerned with the quality of service than with the agency which provides it

On the question of remuneration the British Medical Association was of the opinion that the staffs of voluntary hospitals should accept remuneration Much of the present-day service was given in respect of persons who did not constitute the "poor," and who were willing to contribute and actually did contribute towards the hospital service Dr Hill said that in his experience it was commonly easier to convert lay bodies to the principle of payment of staffs than to convert the staffs themselves It was admitted that the consultants enhanced their reputations by being members of hospital staffs but consultants could not continue to give their services free to 80 per cent of the community in order to live on the fees derived from the other 20 per cent especially since a great number of the 80 per cent attending hospitals were in a position to pay something, and in actual fact were making contributions towards their hospital treatment The Local Government Act of 1929 really brought the consultant right up against this question The local authority was prepared to pay consultants, and no doctor would do work for a local authority for nothing Why then should he do the same work for nothing at a voluntary hospital for the same section of the community?

Dr Hill then turned to maternity and child welfare He said that the Maternity and Child Welfare Act of 1918 arose out of a demand for ante natal care, a service which the profession did not then generally give The Act enabled local authorities to provide the service and most local authorities had adopted the clinic system instead of making use of the machinery of general practice In spite of the provisions of the Act the maternal mortality figure had not improved But although the clinic system had not produced the expected results, local authorities still continued it Dr Hill felt that the undesirable feature of the clinic system was that it resulted in the breaking up of a continuous process into segments in such a manner that the general practitioner who was doing the job at the time of the labour was not the one who looked after the pregnancy Such lack of continuity was not in the best interests of the patient

The Midwives Act of 1936 for England and Wales will do little more than improve the status of the midwife it arose out of an election promise to attend to the midwifery services and deal with maternal mortality But the Act would undoubtedly tempt local authorities to build up a maternity service which would lack the general practitioner Such a development must be guarded against and local authorities should be persuaded instead to co operate with general practitioners Dr Hill said that in the past some members of the profession had encouraged the movement of midwifery away from general practitioners He referred to some advertisements in the columns of the *British Medical Journal* Country practice for sale—no midwifery Practice wanted—little midwifery and so on

In some cities efforts had been made to hospitalize confinements The number of institutional confinements had greatly increased in a number of large towns in two of these maternal mortality had increased and in the third it had not fallen This should encourage a return to domiciliary confinements in which the general practitioner could play his part

Finally Dr Hill referred to the Poor Law medical service By the Local Government Act of 1929 the domiciliary treatment of poor persons remained the responsibility of the Public Assistance Committee In connexion with this service the Association was of the opinion that there should be free choice of doctor for the poor as well as for others at present the system of district medical officers did not admit of free choice

Dr F A ROPER Dr E WARD Dr B VINN DUNN Dr H C JONAS, Dr C D LINDSAY and Dr R H ROBINSON took part in the subsequent discussion

In his closing remarks the speaker as the result of points mentioned by Dr Robinson drew attention to the importance of medical representation on local authorities by means of suitable men who would present to the authority the opinions of the profession A vote of thanks to Dr HILL was proposed by Dr LINDSAY, seconded by Dr R C RIDDELL and carried unanimously with acclamation

SOUTH WALES AND MONMOUTHSHIRE BRANCH NORTH GLAMORGAN AND BRECKNOCK DIVISION

At a meeting of the North Glamorgan and Brecknock Division held at Pontypridd on November 24 1936 Dr F M R WALSHE delivered a British Medical Association lecture on 'Epilepsy' In his easy and charming manner of speech Dr Walshe dealt with the types of epilepsy and their diagnosis prognosis, and treatment A discussion followed

SURREY BRANCH RICHMOND DIVISION

A meeting of the Richmond Division was held at the Grove Road Institution on December 11, 1936, when Lieut Colonel E L GOWLLAND was in the chair The meeting was clinical and had been arranged by Drs G A and DOUGLAS GORDON Many cases of interest were shown and discussed with radiograms A visit was then paid to the wards, where other cases were demonstrated Tea was provided by the matron A vote of thanks was accorded Dr Douglas Gordon for his excellent selection of cases and to the matron for hospitality

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses chest diseases at Brompton Hospital January 25 to 30 intensive course in gynaecology at Chelsea Hospital for Women, February 8 to 20, general practitioners course in medicine surgery, and gynaecology at Royal Waterloo Hospital February 22 to March 6 week end course at Princess Elizabeth of York Hospital for Children February 20 and 21 M R C P courses will be given as follows clinical and pathological at National Temperance Hospital on Tuesdays and Thursdays at 8 p m from February 16 to 25 chest diseases at Brompton Hospital twice weekly at 5 p m February 22 to March 20, heart and lung diseases at Royal Chest Hospital on Mondays Wednesdays and Fridays at 8 p m, March 1 to 20, neurology at West End Hospital for Nervous Diseases afternoons March 8 to 20 A course on anatomy and physiology in preparation for the Primary F R C S examination will be given at Infants Hospital Vincent Square S W on Mondays Wednesdays and Fridays at 5 15 p m from February 22 to May 24 A course of surgical tutorial classes especially intended for Final F R C S candidates is being given at National Temperance Hospital on Tuesdays and Thursdays at 8 30 p m The programme for the next fortnight is as follows January 19 Mr R Y Paton, Deformities January 21 Mr C A Joll Thyroid, January 26, Mr R C Brock Thorax January 28, Mr Hamilton Bailey, Testicle and Prostate

NOTES OF THE WEEK

Industrial Medical Ethics

For some time past a subcommittee of the Medico Political Committee has been considering the position and duties of industrial medical officers with particular reference to their relationship to general practitioners It has now completed the preparation for the approval of the Medico Political and the Ethical Committees, of a set of rules which are intended to govern the practice of both whole time and part-time industrial medical officers The rules first summarize the duties usually performed by industrial medical officers and then formulate an ethical guide for such officers in their relations with the medical attendants of the workers and in the preservation of professional secrecy

Post Office Medical Officers

The Medico Political Committee of the British Medical Association has recently been instrumental in obtaining an increase of 5s in the fee paid by the General Post Office to a Post Office medical officer for examination and report in respect of a member of the public who is involved in an accident on Post Office premises The service rendered in such a case is comparable with that given under the Workmen's Compensation Act and the committee proposed to the General Post Office that a similar fee—namely one guinea—should be paid The Postmaster-General has replied that while he does not admit the existence of special circumstances which justify an increase to this amount of the fee previously agreed upon between the Association and the General Post Office he is prepared to increase the standard fee to 15s

Consett Hospital Reorganization

As a result of suggestions by the Consett Division of the Association the medical staff of the Richard Murray Hospital, County Durham has been reorganized The hospital is governed by a joint board consisting of representatives of the trustees and governors of the hospital and of the Durham County Council and part of the hospital is allocated to the use of the county council The resident medical officer has hitherto been appointed by the county council which was responsible for his salary and his work, so far as the maternity unit was concerned was subject to the administrative control of the county medical officer of health The terms of a recent advertisement of this post, which was submitted for publication in the *Journal* necessitated correspondence between the Association and the joint board on the duties and salary of the appointment in relation to the Memorandum of Recommendations and during the course of these negotiations the county council received a deputation from the Consett Division for the purpose of discussing the future staffing of the hospital The joint board with the approval of the County Health Committee has now decided to reorganize the staff and to appoint a house surgeon, a consulting obstetrician and a consulting surgeon

NATIONAL HEALTH INSURANCE

MEDICAL BENEFIT FOR INSURED WORKERS UNDER 16 YEARS OF AGE

A special conference of representatives of Local Medical and Panel Committees was held at British Medical Association House, London, on January 7 for the purpose of considering the offer of the Minister of Health of a capitation fee of 7s 6d for medical attendance on insured workers under 16 years of age

The following resolutions passed unanimously by the conference have been forwarded to the Ministry of Health and to every insurance practitioner

That the offer of the Minister of Health of a capitation fee of 7s 6d for medical attendance on insured workers under 16 years of age be rejected

That this Conference recommends insurance practitioners to decline service for the provision of medical benefit for insured workers under 16 years of age on the terms offered by the Minister of Health

That in view of the inadequacy of the existing capitation fee and pending the result of negotiations for its increase this Conference is not prepared to accept for attendance on insured workers under 16 years of age a capitation fee less than that which is paid for adult workers

That the Insurance Acts Committee be authorized to take action in the light of the decisions reached by the Conference

INDIA GOVERNMENT—Director of the All-India Institute of Hygiene and Public Health, Calcutta Salary Rs 1,450-Rs 1,750 per calendar month, plus special pay of Rs 400 per month, plus overseas pay of £30 per month

INVERNESS ROYAL NORTHERN INFIRMARY—(1) Hon S for the Ear, Nose, and Throat Department (2) Hon Visiting Surgeon

KING'S LYNN WEST NORFOLK AND KING'S LYNN GENERAL HOSPITAL—H P Salary £125 p a

LANCASTER ROYAL ALBERT INSTITUTION FOR FEEBLE-MINDED—R J A M O (male, unmarried) Salary £375

LEAMINGTON SPA WARNEFORD GENERAL HOSPITAL—H.P Salary £150 p a

LEEDS GENERAL INFIRMARY—R S O (male) Salary £200 p a

LINCOLN COUNTY AND PARTS OF LINDSEY—Assistant County M O H, Tuberculosis Officer, and School M O Salary £500-£25-£700 p a

LONDON COUNTY COUNCIL—(1) Resident Medical Superintendent for Queen Mary's Hospital for Children, Carshalton Salary £1,400 £50 £1,650 p a (2) A M O's (Grade I) for (*a*) Bethnal Green Hospital, E (two positions), (*b*) Lambeth Hospital S E, (*c*) Lewisham Hospital S E, (*d*) Mile End Hospital, E, (*e*) St Alfege's Hospital, S E, (*f*) St Mary Abbots Hospital, W, (*g*) St Peter's Hospital, E Males, unmarried (3) A M O (Grade I, unmarried) to St Charles Hospital, W Salaries £350-£25-£425 p a each

LONDON JEWISH HOSPITAL, Stepney Green, E—Hon S

LOWESTOFT AND NORTH SUFFOLK HOSPITAL—J H S (male) Salary £120 p a

MAIDSTONE WEST KENT GENERAL HOSPITAL—H S (male) Salary £175 p a

MANCHESTER ANCOATS HOSPITAL—(1) H S Salary £100 p a (2) Assistant Surgical Officer Honorarium 10s 6d per attendance

MANCHESTER CITY—Part-time Consultant Obstetrician and Gynaecologist (male) for Withington Hospital Salary £300 p a

MANCHESTER COUNTY MENTAL HOSPITAL, Prestwich—Locumtenent M O (unmarried) Salary £5 5s per week

MANCHESTER HOSPITAL FOR CONSUMPTION AND DISEASES OF THE THROAT AND CHEST—(1) R M O for Ear, Nose, and Throat Department, St Anne's Home, Bowdon (2) A M O for Crossley Sanatorium, Delamere Forest Males Salaries £200 p a each

MANCHESTER NORTHERN HOSPITAL—(1) R H P (2) R H S Salaries £100 p a each

METROPOLITAN HOSPITAL, E—Psychiatrist

MIDDLESEX HOSPITAL W—R M O Salary £400 £50 £500 p a

NATIONAL ASSOCIATION FOR THE PREVENTION OF TUBERCULOSIS, W C—Secretary General Salary £600 p a

NATIONAL TEMPERANCE HOSPITAL Hampstead Road, N W—Medical Registrar Honorarium £42

NEWCASTLE UPON-TYNE HOSPITAL FOR SICK CHILDREN—(1) Senior R M O (male) (2) H P and H S Salaries £250 p a and £100 p a respectively

NEWPORT ROYAL GWENT HOSPITAL—(1) Senior H S (2) H S Males Salaries £250 p a and £135 p a respectively

PEPPARD COMMON BERKS AND BUCKS JOINT SANATORIUM—H P Salary £250

PRESTON COUNTY BOROUGH—J A R M O (female) for Sharoe Green Hospital Salary £100 p a

PRINCESS ELIZABETH OF YORK HOSPITAL FOR CHILDREN, Shadwell, E—Assistant S

RHONDDA URBAN DISTRICT COUNCIL—A M O (female, unmarried) Salary £500 £25 £700 p a

ROYAL LONDON OPHTHALMIC HOSPITAL City Road, E C—(1) Gifford Edmonds Prize in Ophthalmology Value £100 (2) Hon Assistant P

SEAMEN'S HOSPITAL SOCIETY, Greenwich, S E—Resident Medical Superintendent (unmarried) at the Hospital for Tropical Diseases, Gordon Street W C Salary £400 p a

SHEFFIELD EDUCATION COMMITTEE—Part-time M O for the City Training College for Teachers Salary £170 p a

SHREWSBURY ROYAL SALOP INFIRMARY—R H S (male, unmarried) Salary £160 p a

SOUTHEND-ON-SEA GENERAL HOSPITAL—First H S (male) Salary £100 p a

STAFFORDSHIRE COUNTY COUNCIL—Assistant County M O H and M O H for the Brierley Hill Urban District (male) Salary £800 p a

STOKE NEWINGTON METROPOLITAN BOROUGH—Whole-time Assistant M O H (female) Salary £500 £25 £700 p a

STOKE-ON-TRENT BURSLEM, HAYWOOD AND TUNSTALL WAR MEMORIAL HOSPITAL—R H S Salary £175 p a

STOKE ON TRENT CITY—R M O (male, unmarried) at Stanfield Sanatorium Salary £350 £25-£450 p a

STOURBRIDGE DISPENSARY—R M O Salary £350 p a

SURREY COUNTY COUNCIL KINGSTON AND DISTRICT HOSPITAL—(1) Medical Superintendent Salary £1,200 £50 £1,400 p a (2) A M O (female) Salary £600 £20 £700 p a

TORQUAY TORBAY HOSPITAL—Locumtenent R H P (unmarried) Salary £6 6s per week

UNIVERSITY COLLEGE HOSPITAL, Gower Street W C—Whole-time Registrar (non resident) in the X-Ray Therapy Department Salary £250 p a

VICTORIA HOSPITAL FOR CHILDREN Tite Street, Chelsea S W—(1) C O Salary £200 p a (2) H P (3) H S Salaries £100 p a each

WEST END HOSPITAL FOR NERVOUS DISEASES, W—(1) Two R H P (males) Salaries £125 p a. each (2) Hon Psychotherapist for the Out-patient Department

WEST HARTLEPOOL CAMERON HOSPITAL—H S Salary £150 p a

WHITEHAVEN AND WEST CUMBERLAND HOSPITAL—H S Salary £150 p a

WOLVERHAMPTON ROYAL HOSPITAL—A R M O (female unmarried) for the Gynaecological and Obstetric Department Salary £100 p a

YORK BOOTHAM PARK MENTAL HOSPITAL—J A M O (female) Salary £300 p a

MEDICAL REFEREE UNDER THE WORKMEN'S COMPENSATION ACT 1925, for the Deal, Dover, Folkestone, and Hythe County Court Districts (Circuit No 49) Applications to the Private Secretary, Home Office Whitehall, S W 1, by February 3

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 50 51 52 53, 54 55 58 and 59 of our advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 56 and 57

APPOINTMENTS

CLARKE, H Osmond, F R C S, (1) Clinical Tutor in Orthopaedics Manchester Royal Infirmary, (2) Lecturer in Surgical Pathology (Orthopaedic), University of Manchester, (3) Orthopaedic Surgeon, Crumpsall Hospital, Manchester

GLENNY, Elliott T, M B, B S, Medical Instructor Air Raids Precaution Department, Home Office, for South Wales Area Cardiff Centre

LONDON COUNTY COUNCIL—The following appointments have been made at the hospitals and districts indicated in parentheses *Senior Assistant Medical Officers, Grade II* C R M Greenfield M B, B S, D P H (South-Eastern), R M Campbell, M B, Ch B (Park) *Assistant Medical Officers, Grade I* Lauri L Bateman M B, B Ch, B A O (North-Eastern), Mary H Wild, M B B Ch, D P H (Northern), J G Bonnin, M B B S F R C S, M C O G (St Mary Islington), Rosalind B Latter M B, Ch B, and B Schulenburg, M B, B S, F R C S (St James), R A M Yeates, M B, B S (Fulham) *Assistant Medical Officers Grade II* C W C Karran, M B, B Ch (St Pancras), R A A Pellew, M B, B S (Queen Mary's, Sidcup) R V Harris M B B S, and G Melton, M D (Lewisham), G H C Owens M B, B S, F R C S (St James) *House Physicians* D H D Burbridge, M R C S, L R C P (Dulwich), D C Clark, M B B S (St Olaves), R R Willcox, M R C S L R C P, and T P Myles M R C S, L R C P (St James), F D Paterson M B B S (St Andrew's) *House-Surgeons* R F Raynes M R C S L R C P (St James), W R Gauld M B, Ch B (Hackney) J Jamieson M B, Ch B, and Esmé G L Mark, M B Ch B (St Mary Abbots) *Clinical Assistants* H Roland M B B S (St Mary Abbots), Emily S O Thomson, M B, B Ch (Fulham) *Temporary District Medical Officers* J E Ambrose, B M B S B A O (Area III District E Canonbury) L M Shorvon M R C S L R C P (Area VIII, District H Camberwell and Peckham)

ST BARTHOLOMEW'S HOSPITAL E C—*Orthopaedic Surgeon* S I Higgs, B Chir, F R C S *Whole time Officer in X Ray Diagnostic Department* A Meyer, M B, Ch B, D M R E

CERTIFYING FACTORY SURGEONS—F G H Brown, M B, Ch B for the Yealmpton District (Devonshire), A Currie, M B Ch B for the Oban District (Argyllshire), F A V Denning L R C P and S Ed, L R F P S Glas for the Cricklade District (Wiltshire) C D Evans, M B, B Ch, for the Keynsham District (Gloucestershire), T J Evans, M D for the Morriston District (Glamorganshire), H G Hobson, O B E M C M R C S L R C P for the Market Deeping District (Lincolnshire) R G Nethery M R C S L R C P for the Heckington District (Lincolnshire) J I Saville, M B, B S, for the Whitstable District (Kent) J I Stent, M B B Ch for the Shere District (Surrey) J G Warren M R C S, L R C P for the Dartmouth District (Devonshire)

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

BIRTH

MACLEOD—On January 3, at 27 Welbeck Street, W the wife of Mr Cameron MacLeod F R C S of a son

It may be noted here that this was not the first time the Association had investigated the subject of fractures for in 1910 a special committee was appointed to consider the ultimate results obtained in the treatment of simple fractures The report, which was issued two years later, was based on the investigation of 3 000 cases to the records of which the committee was granted access and it was generally regarded as having demonstrated the relative values of the different methods of treatment employed at that time Interest in the report extended to America where the American Surgical Association appointed a committee with a similar object and asked the advice and assistance of the British Medical Association

Nutrition and Other Inquiries

The work of the Committee on Nutrition illustrates the value of the Association as an authority for the conduct of investigations on medico sociological topics The relation of nutrition to health has become a matter of national interest since the war and as its contribution to the subject the Association appointed a special committee, consisting of medical practitioners in different types of practice, a physiologist a dietitian and a statistician to determine the minimum dietary requirements of the individual for the maintenance of health and working capacity and to devise specimen diets The Committee's report aroused both interest and controversy and in order to increase its practical value to the non scientific mind the food quantities indicated were subsequently converted into menus The popularity of the supplementary report under the title of 'Family Meals and Catering' can be estimated by the fact that over 100 000 copies were sold in the first eight months

Only brief mention can be made of other though not less important committees on scientific subjects Their work includes an investigation of the causes and treatment of arthritis and allied conditions a report on psycho analysis which includes a survey of the history and methods of psycho analysis and a reply to criticisms of its theory and practice a consideration of the means of securing improved methods of procedure in the diagnosis and certification of miners nystagmus a survey of the methods of immunization including vaccination available in this country, with a discussion of the practicability of their application to the community generally and a report on the medical aspects of abortion Mention should also be made of a committee which was appointed in consequence of an invitation to the Association by the Minister of Transport to say whether it could usefully make any observations on the place of alcohol in the causes of road accidents The reports of most of the recent committees have been published in pamphlet form and are obtainable at a small cost from the Financial Secretary and Business Manager

Scholarships, Grants, and Prizes

The Council appoints each year a Science Committee which deals with the Association's standing arrangements for the promotion of medical and allied sciences in matters not specially referred to other committees These standing arrangements include the award of a number of science scholarships grants, and prizes The Association was a pioneer in the award of scholarships and grants for the promotion of medical research From a very early date occasional grants of money were made to individuals for specific researches, but since 1874 a definite portion of the Association's income has been allocated to grants for the encouragement of scientific investigation The first scholarships were awarded in 1883 At the present time two scholarships of £200 each founded in memory of Mr Ernest Hart and Professor W E Dixon respectively and three other research scholarships of £120 each are awarded by the Council each year to candidates qualified to undertake research Science grants of an aggregate value of not more than £150 a year are also made each year to suitable applicants for the assistance of medical research work The list of workers whom the Association has helped by means of these awards includes the names of many who have since attained a world wide reputation

The prizes in the award of the Association are the Sir Charles Hastings Clinical Prize open to members engaged in general practice the Stewart Prize for research on epidemic disease the Middlemore Prize for an essay or work on some subject connected with operative surgery medicine and surgery and the Katherine Bishop Harman Prize for the encouragement or research into diseases incident to maternity The first named prize was established by the Association in memory of its founder while the last three owe their inception to endowments by the persons whose names they bear

Lectures, Books, and Meetings

Another provision which is much appreciated by those Divisions and Branches which have taken advantage of it is the organization of B M A lectures These lectures are intended to enable a Home Division or Branch to secure for one of its clinical or scientific meetings each year the services of a lecturer of special standing such as are not likely to be secured on the invitation of a Division or Branch itself or a member thereof The Division or Branch concerned nominates the person it would like to hear and chooses a subject and the arrangements with the lecturer are then made by Headquarters Last year over fifty such lectures were given

The Library of the Association has developed from a small collection of books intended for reference purposes In 1918 its scope was extended to include a Lending Library and it now contains about 30 000 volumes Members appreciation of the facilities offered by the Library increases each year and last year the Librarian reported that the number of readers (that is those attending personally and borrowing books) numbered 24 512 and that 16,227 books had been borrowed He observed that the number of country readers who use the Library continues to increase and that they seem to appreciate the service more than their town colleagues In addition to the provision of books the Library assists members by searching for references and supplying lists of literature on specific subjects The popularity of this service has increased very considerably during the last few years

The Annual Meetings of the Association afford an excellent opportunity for the discussion of scientific subjects of topical interest or of a controversial nature and every year an organized programme for between fourteen and twenty Sections each dealing with a special branch of medicine or surgery is arranged The discussions and debates are open to all members of the Association and they have often been the means not only of promoting interest in the subject concerned but also of disseminating among the profession knowledge of new developments methods

Collective Investigations and Expenditure

From time to time the Association has invited its members to co operate in undertaking research work During the first fifty years of its existence collective investigations formed a prominent feature of its work and in the eighteen-eighties a Collective Investigation Committee existed Burns and scalds, phthisis and

FIG 5.—Low power Ten days after treatment Granulation tissue lining the cervical canal after separation of the slough and before growth of the new epithelium

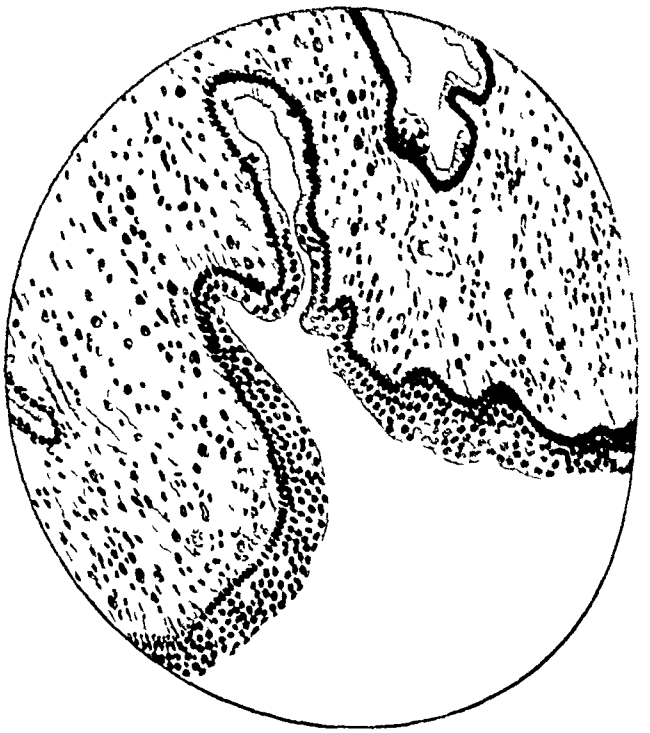

FIG 6.—High power Two weeks after treatment Squamous type of epithelium growing out over surface from columnar epithelium of renal glands

FIG 7.—High power Four weeks after treatment Shedding of superficial layers of squamous epithelium lining the canal to leave the basal layer as the new columnar epithelial lining

to himself or herself or to others or incapable of managing himself or herself and his or her affairs Such a person may under certain conditions be admitted to a licensed retreat and be there detained The patient must voluntarily submit an application in writing and on *an appropriate form, to a justice of the peace and this* must be supported by statutory declaration made by two persons and stating that the applicant is known to them to be an habitual drunkard within the meaning of the Act If the justice is satisfied of the facts and that the applicant understands the consequence of his action he will authorize the detention The applicant may then be detained in the retreat for a term specified not exceeding two years

PUBLIC HEALTH NOTES

Maternal Mortality

The maternal mortality rate in this country is expressed as the number of maternal deaths per 1 000 live births classed to pregnancy and parturition not in or associated with these conditions The denominator of the fraction—namely the number of live births—does not represent the population exposed to risk as in addition to those who have been delivered of a living child there are those who have had stillbirths abortions and miscarriages and those who die before actual parturition Stillbirths are now notified and their number is known It has been shown that the rates whether based on live births alone or on total births—that is of live births and stillbirths—closely correspond though obviously the latter figure is slightly lower With regard to the extent of other types of risk however no information is available As an index to the efficiency of maternity services the use of the maternal mortality rate is largely vitiated by the inclusion of deaths from abortion as in many cases the circumstances leading to the death could not be considered as legitimate risks of pregnancy or parturition which it is presumed the rate is supposed to represent

Dr A G G Thompson medical officer of health for the Lambeth Metropolitan Borough Council in his annual report for 1935 refers to this aspect

> As in previous years the Lambeth rate this year depends largely upon the number of unwanted pregnancies terminated in abortion In classifying abortion among the various causes of death the Registrar General has three choices Where the woman herself brings about the abortion from which she dies the cause is classed as suicide where the abortion is due to interference by others the cause is manslaughter and where there is no evidence available pointing to active interference either by the woman herself or by others then the death is deemed to be due to maternity It will be realized from such a classification that much of the fear of death from ordinary maternity has been misplaced and that the phobia fostered in recent years may do as much harm as good

Deaths after Abortion

Dr P V Pritchard deputy medical officer of health for the St Pancras Metropolitan Borough Council in the annual report of the medical officer of health for the year 1935 discusses the same point In his district there were four deaths from post abortive sepsis and one from peritonitis following a septic abortion in which at the coroner's inquest an open verdict was returned

> The topical outcry is that this country is losing several thousand women each year in childbirth and that these deaths are mostly needless and preventable by better work and co operation by those people who are responsible for the whole scheme of ante natal and midwifery services—the doctors midwives and public health officers How can these people be blamed for the abortion mentioned here Can any improvement in their service prevent a similar occurrence Such deaths and others like the case quoted in the Registrar General's table of acute intestinal obstruction which followed but was not necessarily due to a recent parturition are officially included in the maternal mortality figures and rate They must taint the truth of these statements If the same indefinite allocation is being made throughout the country for each of the hundreds of local authorities the maternal mortality for England and Wales must be unreliable to the possible extent of several hundred deaths each year This would affect the rate by a considerable percentage A clear and concise definition is required Any cases of deaths other than those which are usually possible in a pregnancy or confinement should not be included as maternal deaths For example abortions with any circumstance pointing to criminal or unintentional interference should be excluded Even at the risk of a few mistakes in these exclusions the resulting figure would be nearer the truth than at present

Before 1911 medical practitioners were asked not to certify deaths to include childbirth on the certificate of those women dying within one month of parturition even though it was not considered a contributory cause of death Since that year however the request has been amended and now certifying practitioners are asked to include on the certificate reference whether parturition or miscarriage has been in any way a contributing cause of death In New South Wales a convention was introduced by Dr D'Arcy Bevan that the death of a woman between the ages of 15 and 45 should be considered a maternal death unless it was proved to be unconnected with pregnancy Dr Dunstan Fox medical officer of health for Swindon has applied the cases in his district from this aspect In spite of many deaths being obviously attributable to pregnancy it proved necessary to inquire into only a very small number of cases Nevertheless the result of the investigations was the discovery of many suspected cases which had they been included would probably have raised the maternal mortality rate for the district

Social Factors

In the Registrar General's statistics for the year 1930 there is a return showing the maternal mortality rate of various groups graded according to the social class of the husband Per 1 000 live births the rate for the professional group was 4 44 for the group of skilled workers 4 11 for the semi skilled 4 13 and for the unskilled 3 89 The risk from fatal puerperal sepsis diminished on passing down the scale but the converse held for puerperal haemorrhage The rate for puerperal *albuminuria* convulsions and other toxaemias was lowest for the unskilled class These figures of course cannot be taken at their face value one of the factors influencing the risk of death in pregnancy or in parturition being the parity of the women In many of the cases of maternal death the risk is higher at the first than at any of the later pregnancies while the rate tends to rise in women who have had many children The size of the family which differs in the different social classes might then be reflected in a higher rate in that class in which the proportion of confinements of first pregnancies is higher In the annual report of the Medical Officer of Health for the London County Council for 1935 it is shown that the areas containing the poorest and most overcrowded populations in London show a lower maternal death rate than does London as a whole

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

CRETINISM AND MYXOEDEMA

BY

H GARDINER-HILL, M D, F R.C P.

Hypothyroidism occurs in two main forms—cretinism in children, myxoedema in adults Both conditions are due to simple insufficiency of the thyroid gland

Only the sporadic form of cretinism will be discussed in this article as the endemic variety is not a result of simple thyroid deficiency Its aetiology is intimately associated with endemic goitre, and it occurs in the later generations of families suffering from endemic goitre The pathogenesis of endemic cretinism cannot be regarded as one of simple hypothyroidism Sporadic cretinism is found in regions where goitre is not endemic and bears little relation to the endemic variety It is said that heredity is seldom a factor, and this is certainly true in my experience The picture is typical of simple athyroidism This may be attributable occasionally to thyroid maldevelopment but usually to atrophic changes in the foetal gland resulting from acute thyroiditis, probably the sequel of infective disease in the mother during pregnancy

Myxoedema is the syndrome of thyroid deficiency in the adult There may be an antecedent history of hyperthyroidism, the result of emotional stress or some septic process which has caused an exhaustion atrophy of the gland Other cases result from too great a removal of thyroid tissue by thyroidectomy Myxoedema may also develop as an end-result of repeated pregnancies or may appear with the termination of ovarian activity at the climacteric Williamson and Pearse have suggested that myxoedema is the end-result of lymphadenoid goitre There may be very little thyroid enlargement, but a marked fibrosis of the gland occurs They, in conjunction with McCarrison, are of the opinion that the condition results from a faulty diet, especially deficient in vitamin A rather than in iodine

Clinical Picture of Cretinism

The clinical features of cretinism are striking disturbance of growth, mental retardation, and delay in sex development The characteristic growth disturbance is a disproportionate dwarfism, the limb measurements being unduly short when compared with the trunk This is associated with retardation of bone development, especially in the long bones, and a delay in the appearance of the centres of ossification Mental retardation is an invariable accompaniment of cretinism The reaction of the child to stimuli is peculiarly slow and characteristic If untreated, the mental state is seriously impaired Mental processes become slower and slower, and, in severe cases, imbecility results High-grade cretins may, in fact, be devoid of response to the ordinary mental and physical stimuli and lie about in a state of imbecilic apathy Retardation of sex development in untreated cretinism is also pronounced Puberty may be indefinitely delayed and the secondary sex characters fail altogether to appear

Though the main clinical features of cretinism are physical and mental backwardness other symptoms develop which produce a striking clinical picture The facies of the cretin child is coarse and puffy, the complexion becomes pasty and sallow the hair dry, and the tongue broad, large, and thick The extremities are cold and cyanosed and the temperature consistently subnormal Myxoedematous deposits appear above the clavicles making the neck appear short and thick The fingers tend to be broad and square at the tips and the skin is dry

Myxoedema

The clinical picture of myxoedema in adults is in many ways similar, although the onset of hypothyroidism in the fully developed individual cannot be accompanied by disturbance in growth Regressive changes in the genital organs are nearly always present It must be remembered that myxoedema is a protean disease extremely insidious in its onset, and may present itself under various guises Mental changes are frequently the earliest symptoms It is not at all uncommon to find that the patient fails to recognize any deterioration in health This is no doubt partly due to the slowing up of all mental processes which is such a striking feature of the condition

To illustrate this, of the first 101 cases of myxoedema I saw, in fifty the thyroid condition was recognized by the doctor only during the course of some intercurrent illness The individuals had not previously complained of ill health In the other fifty-one cases the patients sought medical advice for symptoms which were attributable to hypothyroidism Nineteen complained of general swelling of the body, face, hands, and feet, seventeen observed loss of power and sensory disturbances—pins-and-needles and numbness of the limbs, eighteen mentioned as one of their first symptoms lethargy, weakness and undue fatigability Other symptoms complained of were menorrhagia and floodings, subjective feelings of cold, alterations in voice and speech, loss of hair, and loss of memory Some patients with myxoedema may seek medical advice for obesity, sterility repeated miscarriages and stillbirths, or chronic rheumatism

The clinical picture of fully developed myxoedema is characteristic The skin is dry, the eyelids puffy myxoedematous deposits occur in the subcutaneous tissues and the hair becomes extremely dry and brittle and is often shed not only from the head but from the eyebrows The movements become clumsy speech is slow and characteristically indistinct, the temperature is subnormal, and intense subjective feelings of cold are complained of

In both cretinism and myxoedema certain abnormalities occur in the metabolic sphere The basal metabolism is reduced to an extent found in scarcely any other pathological condition Levels of 40 per cent to 50 per cent below the normal limits are usual Investigations of the basal metabolic rate are of great value as a means of confirming the clinical diagnosis

Diagnosis

The clinical picture of both cretinism and myxoedema in their fully developed forms is so typical that no difficulty is likely to be experienced in diagnosis at this stage In early and mild cases however, the problem is less easy, though, if the characteristic clinical features are borne in mind suspicions of thyroid deficiency should

produce While on this subject may I venture to correct a misapprehension which I believe exists I have in mind the case of a person who has been authorized to transfer as from the end of a quarter Now that person may be accepted by his new doctor before the end of the quarter There is no reason whatsoever why this should not be done But the person is not entitled to treatment from his new doctor—and by this I mean prescriptions on the committee's form—until the authorized date—namely the first day of the next ensuing quarter Some doctors appear to think that they are under obligation to provide treatment during the intervening period but this not so

Poisons—As you are probably aware Rule No 12 (2) (*e*) of the Poisons Rules 1935 requires a prescription ordering a substance included in the Fourth Schedule to those Rules (the barbiturates are included in this schedule) to indicate the total amount of the medicine to be supplied and the dose to be taken You will save chemists much trouble if when ordering a preparation included in the schedule you will be so good as to comply strictly with the requirements of the Rule 'To be taken as directed' is hardly an indication of the dose so far as the chemist is concerned

Forms of Medical Record—The form of medical record contains spaces for the addresses of insured persons Many practitioners when they become aware of a change of address make the necessary note on the form of medical record This ought to be done in every case and if it has not been your practice to do so it would be very helpful if you would do so in future We do not receive automatically changes of address here so we are unable to correct our records in this respect.

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Lieutenant Commander C Ommanney Davis has retired *from the Service at his own request*

Surgeon Lieutenant D Ewart has been transferred to the Emergency List

W Boyd F A Crosfill G C D'Arcy F P Ellis R V Jones W S Miller L R Norsworthy B O'Neill G R Rhodes and P G Stainton have entered as Surgeon Lieutenants for short service and have been appointed to the Royal Naval Hospital Haslar for course

G H C R Critien has entered as Surgeon Lieutenant for short service

ROYAL NAVAL VOLUNTEER RESERVE

The commissions of Surgeon Lieutenants W S Miller and R V Jones have been terminated on transfer to the Royal Navy

ROYAL AIR FORCE MEDICAL SERVICE

Wing Commander R H Stanbridge to Princess Mary's R A F Hospital Halton for duty as Medical Officer

Flight Lieutenants P A Cooper to No 31 (Army Co operation) Squadron Karachi India C M Fraser and J F McGovern to Central Medical Establishment London W C W P Stamm to R A F Station Abbotsinch

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Captain W R Everatt from Territorial Army Reserve of Officers (5th Battalion West Yorkshire Regiment) to be Captain with seniority November 24 1935

To be Lieutenants G H James late Cadet St John's School Contingent Junior Division O T C J C Fletcher late Officer Cadet Edinburgh University Contingent Medical Unit Senior Division O T C

Supernumerary for Service with the O T C—Lieut Col J du P Langrishe D S O (Lieutenant-Colonel Reserve of Officers) has resigned his commission in the Territorial Army Major A MacG Duff M C R A M C T A to command the Medical Unit of the Edinburgh University Contingent Senior Division O T C

INDIAN MEDICAL SERVICE

Lieut Cols F J Anderson M C (July 28 1935) N C Kapur (November 15 1935) and H E Murray (December 22 1935) have been appointed to the Civil Branch of the Indian Medical Service as from the dates indicated in parentheses

Majors L G Pearson and P M Antia to be Lieutenant Colonels

The promotion of Major S L Patney to the rank of Major has been antedated to February 2 1929 He qualified for accelerated promotion on October 13 1926

Scholarships and Grants in Aid of Scientific Research

Scholarships

The Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows an Ernest Hart Memorial Scholarship of the value of £200 per annum a Walter Dixon Scholarship of the value of £200 per annum and three Research Scholarships each of the value of £150 per annum These Scholarships are given to candidates whom the Science Committee of the Association recommends as qualified to undertake research in any subject (including State Medicine) relating to the causation prevention or treatment of disease Preference will be given other things being equal to members of the medical profession Each Scholarship is tenable for one year commencing on October 1, 1937 A Scholar may be reappointed for not more than two additional terms A Scholar is not necessarily required to devote the whole of his or her time to the work of research but may hold a junior appointment at a university medical school or hospital provided the duties of such appointment do not interfere with his or her work as a Scholar

Grants

The Council of the British Medical Association is also prepared to receive application for Grants for the assistance of research into the causation treatment or prevention of disease Preference will be given other things being equal to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine

Conditions of Award Applications

Applications for Scholarships and Grants must be made not later than Saturday May 8 1937 on the prescribed form a copy of which will be supplied on application to the Medical Secretary of the Association B M A House Tavistock Square London W C 1 Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated

the strength of the former It would generally be agreed that the desiccated extracts are more reliable and more stable, and now that they are available it would seem better to use them in all cases Synthetic thyroxine, which has recently been introduced, appears to possess no advantages over the dried gland preparations—in fact, the majority of clinicians would probably agree that it is of distinctly less value

In conclusion, it cannot be emphasized too strongly that to obtain good results in the treatment of hypothyroidism a standardized and reliable preparation of thyroid extract should always be used

PHYSICAL EDUCATION IN SCHOOLS

LONDON CONFERENCE

One of the series of educational conferences at University College, London, held on January 8, was arranged by the Medical Officers of Schools Association, when the subject of the education of the body in public, secondary, and preparatory schools was discussed

Dr E KAYE LE FLEMING, chairman of the Physical Education Committee of the British Medical Association, addressed the conference He discussed first the bearing of nutrition on physical education In the schools under consideration the possibility of any total insufficiency of food might be dismissed, but the best-calculated diet sheet in public schools failed to disclose quality and the style of cooking and serving He was sorry to learn that in many schools fresh fruit was an "extra" to be paid for The spacing of meals was an important matter He knew of a large public school where nothing was provided between the midday meal and 6 o'clock in the evening, although not only school lessons but active games had been taken A great deal of unhealthy overcrowding still existed in school dormitories, an important factor in school epidemics He also touched on the matter of clothing, advocating a minimum, but differentiating sharply between this and nudism

The body, Dr Le Fleming continued, was a machine controlled by the will and capable of almost an infinite variety of development The contortionist, the skater, the first-class golfer, the typist, were all examples of special development of muscular facility, but that was not the object of the development of the body, as he saw it, in the schools Any specialized development of the human body could best be brought about on the basis of a sound development of the whole system—to quote the report of the B M A Committee, "An educated body is a balanced body" Poise or balance and the grace associated with it might be excellently studied in the playing of games by experts, especially as recorded by the slow-motion film

Body Development

He proceeded to speak of three practical examples of body development which had come home to him with great force At the outbreak of war in 1914 some of the finest young men in the country were among the first recruits Dr Le Fleming thought particularly of a number who went to a camp in the South of England, living for a time in the open and later under canvas, with abundance of simple food and exercise Fit as they were to begin with these men actually grew out of their clothes before uniform was provided for them, so quickly did they respond to this open-air environment, but immediately they went into billets in December large numbers of them went on the sick list, a result of the change from an outdoor to an indoor life His second example was from the Military Tournament at Olympia last year where he had been particularly struck by the display given by eighty men of the Royal Air Force He was told that they had all been taken out of the distressed areas the previous January, which made him remark to his hosts of the Air Force that he wished he could have them to take on tour round the schools of the country to show what physical education could do in a short time Recently the question of Army recruiting had come forward The work of the Army in physical education had been most carefully and scientifically carried out for many years, and although the dearth of A1 recruits had been so marked that second-class material had to be taken, the results with this material, thanks to the system employed, had been amazing

The first problem in connexion with the schools was to get the conception of the value of physical education into the minds of the head masters There were notable exceptions, but, on the whole, head masters were not sufficiently convinced *Quis custodiet ipsos custodes?* Dr Le Fleming was alive to the difficulty in schools of determining the relation between physical education and games In the B M A Committee report it was pointed out that education and games were all part of the same thing *Physical education* was part of the preliminary training for games, which were themselves specialized products of physical education Physical education in schools could be made interesting by being linked to games, and brought under the control of the one master It was commonly said that there was no time for physical education But if its proper value were acknowledged time would be found for it The reason why time was not found was because it was not considered so important as academic subjects

Need for Trained Instructors

Finally there was the problem of finding the teachers for the teaching of physical education on modern lines While aware of the Carnegie Physical Training College at Leeds and one or two other institutions he felt that there was a great dearth of centres so far as men were concerned, women had more facilities If physical education was to be properly developed it required also the close co-operation of educationalist and doctor Physical education was itself a most important part of preventive medicine, but it had not yet emerged on to the scientific field Science was measurement, and as yet the measurements of physical fitness had not been worked out There were no accepted scientific medical standards for physical fitness at all Every doctor, for example, had his own method of testing normal heart tolerance to exercise Even in the Services there was no uniform system of testing heart tolerance There ought to be some centre where the problems could be studied scientifically The universities were the obvious resource but at present those concerned with this subject found little encouragement in academic quarters

General Discussion

In some further discussion Dr C W ROE (St Paul's School) advocated a six-months course of physical and educational training for all boys between 15 and 19 They could take this course at any convenient time during that period, they should be boarded in hostels or other suitable buildings at the expense of the State, and should be graded according to physique and mentality Dr A H MACDONALD (chief medical officer of Dr Barnardo's Homes) said that only 1 per cent of the new admissions to the Homes were physically A1, but owing to the combination of nutrition and physical exercise 30 per cent of the boys when they left the Homes were in that category Dr L R LEMPRIERE (Hurleybury) contested Dr Le Fleming's assumption that crowded dormitories were the cause of school epidemics He thought the spread of infection more likely in classroom and common room

Dr E H T NASH, in discussing the readjustment of the school curriculum to admit of a greater proportion of physical education, expressed the view that from the standpoint of fatigue a number of the academic periods were unduly long, if these were shortened there would be periods for physical education could be worked in

serous exudate owing to the large areas of skin affected the dressings presenting a difficult problem general anaesthesia sometimes being necessary

In reply to questions asked by Drs FOURACRE WHITEHEAD J F GILL L I HARDY G G SMITH and D D STENHOUSE STEWART the lecturer stated that very often neuroses followed gastro intestinal and laryngeal cases This was noticeable also in lung cases and was a psychosis Normal lungs permanently recovered but lungs which had previously had bronchitis or tuberculosis as a rule did not completely recover He also described plans for the benefit of the general population As regards dressings he agreed that gas and oxygen was a useful anaesthetic and that 5 per cent tannic acid in 2 per cent dettol and crude cod liver oil were very useful applications The modern masks carried a ten year guarantee The skin could be protected for approximately twelve hours by an antidote ointment The life of the canister surface anaesthesia and the delayed effects on the eyes were also discussed Dr MORRISON proposed seconded by Dr T MOLTON J STEWART a vote of thanks to Major Blackmore which was received with acclamation

LANCASHIRE AND CHESHIRE BRANCH ROCHDALE DIVISION

A meeting of the Rochdale Division was held at Rochdale Infirmary on December 11 1936 when Dr F W MACKICHAN was in the chair

The honorary secretary of the Lancashire and Cheshire Branch Mr R L NEWELL (Manchester) delivered an interesting and valuable lecture on Minor Surgery of the Anus and Rectum Mr Newell laid emphasis on the necessity of rectal examination in all abdominal cases and the scope of digital proctoscopic and sigmoidoscopic examinations was defined In children the two commonest minor ailments were papillomata and partial prolapse Mr Newell gave clear indications for the treatment of these but was of opinion that the prolapse cases needed the discipline of hospital or nursing home for cure In cases of piles palliative treatment should be tried in slight cases and was frequently successful Injection with 5 per cent phenol in olive oil was of great value in properly selected cases—namely internal piles with no prolapse or with only a slight tendency to prolapse Done with care relief of symptoms persisted for about a year when reinjection was usually necessary but as the treatment was ambulatory and entailed no absence from work the method was of great value Cases of early fissure in ano often responded to minor methods and the injection of the sphincter and base of the fissure with A B A often relieved the spasm of the sphincter for several days and combined with application of silver nitrate or nitric acid to the fissure gave in many cases excellent results The fissure with a fibrous base required operation Several members took part in the discussion which followed and on the proposal of Dr W H BATEMAN seconded by Dr A M MCMASTER Mr Newell was cordially thanked for his most helpful lecture The matron and her staff kindly provided light refreshments after the meeting

LINCOLNSHIRE BRANCH KESTEVEN DIVISION

A meeting of the Kesteven Division was held at Grantham on December 8 1936 when Dr W H WILKIE was in the chair

Dr Charles Frier was elected representative and Mr F Joselin Jauch deputy representative in the Representative Body It was the unanimous opinion of the meeting that the provision of public mortuaries for the reception of dead bodies and for post mortem examinations was unsatisfactory particularly in country areas The SECRETARY drew the attention of the meeting to a further course in air raid precautions

Dr HENRY MACCORMAC delivered a lecture on Pitfalls and Bridges in Dermatology Dr MacCormac's address was fascinating and highly instructive and had an excellent reception He was accorded a hearty vote of thanks

MALTA BRANCH

At a clinical meeting of the Malta Branch held at the Aula Magna of the University of Malta on December 11 1936 Surgeon Lieutenant Commander C H BIRT opened a discussion on Diphtheria In addition to members of the British Medical Association his audience included members of the Camera Medica and final year students who had been invited to the meeting

METROPOLITAN COUNTIES BRANCH CITY DIVISION

The annual dinner dance of the City Division was held at Park Lane Hotel on December 17 1936 when Dr J E RICHARDS was in the chair and 160 members and guests were present Sir GEORGE JONES M P for Stoke Newington proposed the toast of The British Medical Association Dr R W DURAND (Assistant Medical Secretary) responded The entertainment which followed included a sing-song by miners choir and a cabaret A most enjoyable evening was spent by all and the proceedings ended at 1 a.m.

METROPOLITAN COUNTIES BRANCH WESTMINSTER AND HOLBORN DIVISION

A successful and interesting meeting of the Westminster and Holborn Division was held at the Florence Powell Club on December 10 1936 when following an informal dinner Dr STANLEY WHITE gave an address on The Clinical Application of the Sex Hormones The address was illustrated by lantern slides

NORFOLK BRANCH WEST NORFOLK DIVISION

At a meeting of the West Norfolk Division held at the Norfolk and Kings Lynn General Hospital on November 19 1936 Dr K D LAWRENCE delivered a British Medical Association Lecture on The Practitioner and Diabetic Emergencies Dr Lawrence began by describing the life of Allan Banting and Best the discoverers of insulin and discussed the various occurrences which may disturb the proper balance He went fully into the question of diagnosis of diabetic coma and insulin coma and described the emergency measures necessary to deal with either D Lawrence answered a number of questions at the end of his lecture for which he was warmly thanked

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION

A meeting of the North Northumberland Division was held at Berwick Infirmary on December 16 1936 when there was a good attendance including several members from Berwick Dr R A Welsh was elected representative and Dr D T McDonald deputy representative in the Representative Body

The meeting agreed that the minimum fee for a general anaesthetic given for dental work should be £1 1s. It also agreed that the interests of the members of the Division so far as the provisions of the Midwives Act 1936 were concerned could be safely left in the hands of the three members of the Division who had been appointed by the Branch Council as members of the Northumberland Subcommittee to confer with the county medical officer in accordance with the Act The three members are Dr R E Moles D Welsh and Dr D T McDonald Dr E CHALMERS FOWLER then gave an instructive address on Domiciliary Midwifery which he dealt with many of the difficulties encountered by general practitioners and indicated how they could be satisfactorily be dealt with Dr W R Sprunt agreed to undertake any local arrangements in connexion with the Treasurer's Cup golf competition

SOUTH WESTERN BRANCH TORQUAY DIVISION

A special general meeting of the Torquay Division was held at Torbay Hospital on December 10 1936 when Dr G ALLEPTON was in the chair Among the members were Dr G H M Hemsted H C Jonas C M Kennedy C D Lindsay and F A Roper

Address by Deputy Medical Secretary

Dr CHARLES HILL (Deputy Medical Secretary) gave an address on The Effects of Recent Legislation on Medical Practice It was by the Local Government Act of 1929 that the old Poor Law hospitals were transferred from the guardians to local authorities—county councils and county boroughs councils The old Poor Law hospital catered only for the destitute Under the new regime a local authority was able to admit to its hospitals any inhabitant in the area whatever his means and to charge for his maintenance according to his ability to pay up to the cost to the authority Appropriation of Poor Law infirmaries by local authorities for the purpose of rebuilding re-staffing and re-equipping them as hospitals in many cases that the quality of the service had greatly improved Local authorities who could draw upon the rates were able to extend and equip in a way which would be beyond the means of many voluntary hospitals The development of municipal hospitals should lead voluntary hospitals to examine themselves to ask if they were giving the best possible service to the district if they were leaving fields of activity untouched and therefore *tempting* the local authority to fill them The proper function of the local authority was to see that hospital provision in the area was adequate and efficient Dr Hill

the mid-winter season of the Southern Hemisphere The outbreak on the mainland, like that in the Falklands, was of a very mild type The only contact with Bahia Blanca during this period was through a cargo boat that arrived from there in Stanley on August 21, no cases of influenza, however, were observed among the townsfolk after this visit

On August 28 the s s *Lafonia* arrived back in Stanley, having called at eleven stations on the East and West Falklands since leaving Magellanes on August 21 No cases of influenza were reported from these places, where the actual contact with the *Lafonia* was limited to unloading and loading cargo on very exposed jetties During the ship's stay in port on this occasion two of her crew were detained in Stanley with acute bronchitis, pyrexia, and joint pains On August 30 the *Lafonia* left Stanley and proceeded to West Falkland On September 5, three days after she had touched at a port on that island, an epidemic of influenza broke out and spread to each place visited by the mail officer from the ship On the same date a definite epidemic of influenza—of the bronchial-catarrhal type and short in duration—broke out in Stanley the whole town was affected

It is interesting to note the long latent period between leaving Magellanes on August 21 and the outbreaks on the East and West Falklands on September 5 During this time, although the s s *Lafonia* visited numerous ports before reaching Stanley, no cases of sickness were reported except those of the two members of the crew who were detained in Stanley on August 29 This is probably due to the brief contacts made and the conditions of unloading at each port, and to the fact that the two men who later reported sick were neither of them deck-hands, the deck-hands themselves all seemed to be fit except for slight colds, which are very prevalent at that time of year When these men reported sick they had been feeling ill for several days They were detained in Stanley, but they obviously left the virus behind with the crew of the *Lafonia* as well as bringing it on shore The virus in both places remained dormant until the weather conditions of September 3 precipitated an epidemic in Stanley and in the West Falklands In view of the fact that during the epidemic the period of incubation was established at forty-eight hours, this curious latent period is difficult to understand

Mode of Spread

It was observed and established that forty-eight hours after the time of contact the victim suddenly went down with excessive joint pains, with marked increase in the pulse rate and a high temperature, the average being 102° F The onset was followed by an acute bronchitis with rather a dry cough, after three to five days the condition cleared up, leaving the patient with a feeling of lassitude which lasted for some time Old people suffered most There were three cases of bronchopneumonia, and several patients had persistent tachycardia, at least one of them dying as a result of working too soon after recovery from influenza

On the East Falklands the disease spread wherever contact with Stanley was made It was possible to warn certain settlements by telephone of the outbreak in Stanley, and some managed to isolate themselves satisfactorily, but during the first twenty-four hours of the epidemic some farm-hands left the town and carried the disease with them to the houses and settlements that they visited The progress of the disease could be quite definitely traced as these men spread about the island and as contact was made with the houses which they had visited For instance one of the members of a household visited by a labourer returning from Stanley came into his settlement for a dance which was being held there A man from a neighbouring settlement was also present The day after the dance the first man developed influenza, and it was soon raging round the settlement, a couple of days after the dance the visitor from the other settlement also developed influenza and spread it around his settlement, where all but five persons were affected

When other managers heard how infectious the epidemic was they forbade any of their men who were in Stanley at the time to return to their settlements, and refused to allow any persons from infected areas to cross their lands, thus ensuring themselves against loss of working time through sickness As a result of these precautions the island could be divided into sharply defined areas where the disease was or was not present On the West Falklands the progress of the disease was much the same, only one or two isolated places escaping In Stanley the epidemic raged from September 5 until about October 5, with periods of exacerbation which seem to have been influenced by climatic changes At its height the schools were closed for three weeks

Meteorological Influences

The epidemic broke out on September 5, and between September 1 and 7 the following meteorological readings were taken It should be remembered that in the South Atlantic seas it is found that the cold winds come from the south and that the south-east winds are cold and damp

TABLE I—*Meteorological Readings from September 1 to September 7*

Date	Barometer Mean Pressure in Millibars	Maximum Temperature Fahrenheit Screen	Minimum Temperature Fahrenheit Screen	Wind	Rain	Hours of Sunshine	Re
Sept 1	1012	36	28	S W (6)	0 02	4 1	Snow

„ 7	1003 4	36	29	W S W (5)	0 21	2 5	—

On September 19 relapses were common and further outbreaks occurred The meteorological readings between September 15 and 21 are shown in Table II

TABLE II—*Meteorological Readings from September 15 to September 21*

Date	Barometer Mean Pressure in Millibars	Maximum Temperature Fahrenheit Screen	Minimum Temperature Fahrenheit Screen	Wind	Rain	Hours of Sunshine	Re
Sept 15	998	43	31	W (5)	0 16	5 4	—
16	1003 8	41	27	W S W (5)	0 16	6 5	—

21	995 2	46	34	W N W (4)	0 02	8 3	—

Conclusion

During the epidemic it was observed that forty-eight hours was the period of incubation, therefore one would expect the weather two days previous to the outbreak to be of relevant interest, this is confirmed by a study of Tables I and II The original outbreak was on September 5, and on September 19 there was a few

ASHTON UNDER LYNE DISTRICT INFIRMARY—H S Salary £1 0 p.a

AYR COUNTY HOSPITAL—Two R H S (males) Salaries £125 p.a. each

BEDDINGTON AND WALLINGTON URBAN DISTRICT COUNCIL—Medical Officer of Health Salary £800 p a

BIRKENHEAD GENERAL HOSPITAL—(1) Senior H S Salary £150 p.a (2) Second H S (3) H.P (4) C O Salaries £100 p a each Males

BIRMINGHAM CITY—R.A M O (male unmarried) for the Tuberculosis Section Salary £400 £425 £4 0 p.a

BIRMINGHAM CITY EDUCATION COMMITTEE—Part time Aural S Remuneration £2 12s 6d per session

BIRMINGHAM ROYAL CRIPPLES HOSPITAL—R H S (male unmarried) Salary £200 p a

BIRMINGHAM UNIVERSITY—Whole time Dental Clinical Assistant at the Dental Hospital Stipend £500 p a

BLACKBURN LANCASHIRE MENTAL HOSPITALS BOARD Brooknall—A M O (unmarried) Salary £500 £25 £600 p.a

BOOTLE COUNTY BOROUGH—Assistant M O.H and Assistant School M O (male) Salary £600 £30-£750 p a

BOURNEMOUTH ROYAL VICTORIA AND WEST HANTS HOSPITAL—(1) Hon Orthopaedic S (2) Hon Assistant S

BRISTOL COSSHAM MEMORIAL HOSPITAL Kingswood—J R M O (male) Salary £100 p.a

BURY INFIRMARY—(1) R S O (male) (2) H S Salaries £300 p.a and £175 p.a respectively

CANTERBURY KENT AND CANTERBURY HOSPITAL—H.P (male unmarried) Salary £125 p a

CARDIFF ROYAL INFIRMARY AND THE WELSH NATIONAL SCHOOL OF MEDICINE—Part time Hon Dermatologist and M O in Charge of Male Venereal Diseases Centre

CHESTERFIELD AND NORTH DERBYSHIRE ROYAL HOSPITAL—H S (male) to Ophthalmic and Ear Nose and Throat Department Salary £150 p a

CITY OF LONDON HOSPITAL FOR DISEASES OF THE HEART AND LUNGS Victoria Park E—H P (male) Salary £100 p a

DONCASTER ROYAL INFIRMARY AND DISPENSARY—(1) R S O (2) Casualty H S Males Salaries £250 p.a and £175 p.a respectively

DERBY DERBYSHIRE ROYAL INFIRMARY—Gynaecological H S and Emergency Anaesthetist (male unmarried) Salary £150 p a

DEWSBURY AND DISTRICT GENERAL INFIRMARY—(1) Senior H S (2) Second H S Males Salaries £200 p.a and £1 0 p.a respectively

EALING BOROUGH—R A M O (male unmarried) Salary £350-£25 £550 p.a

EAST HAM MEMORIAL HOSPITAL Shrewsbury Road E—H P (male) Salary £150 p a

EASTBOURNE PRINCESS ALICE HOSPITAL—R H S (male) Salary £150 p.a

EASTBOURNE ROYAL EYE HOSPITAL—H S (non resident) Salary £100 p a

EDINBURGH GENERAL BOARD OF CONTROL FOR SCOTLAND—Deputy Commissioner (male) Salary £758 £953 p.a

ENFIELD URBAN DISTRICT COUNCIL—Deputy M O H and Assistant School M O (male) Salary £600-£25 £750 p a

ESSEX COUNTY COUNCIL—J R M O for Oldchurch Hospital Romford Salary £250 p a

EVELINA HOSPITAL FOR SICK CHILDREN Southwark S.E—H P (male) Salary £120 p.a

GLAMORGAN COUNTY COUNCIL—A M O (male) Salary £550-£25 £750 p a

GLASGOW WESTERN INFIRMARY—(1) Assistant Radiologist (2) Assistant Radium Therapist Full time posts Salaries £400 p.a and £300 p a respectively

GLOUCESTER COUNTY—County M O H and School M O Salary £1 200 p.a

GLOUCESTER GLOUCESTERSHIRE JOINT COMMITTEE FOR TUBERCULOSIS—J.A M O (male) for Stardish House Sanatorium Stonehouse Salary £250 p a

GRIMSBY AND DISTRICT HOSPITAL—(1) Senior H S (2) H P Male Salaries £200 p.a and £150 p a respectively

HALIFAX ROYAL HALIFAX INFIRMARY—Third H S (male unmarried) Salary £150 p.a

HERTFORD COUNTY HOSPITAL—H P (male) Salary £150 p.a

HERTFORDSHIRE COUNTY COUNCIL—H S for County Institution St Albans Salary £150-£175 p.a

HOSPITAL FOR EPILEPSY AND PARALYSIS Maida Vale W—Hon Psychiatrist

HOUNSLOW HOSPITAL—R S O Salary £250 p.a

HULL CORPORATION HEALTH DEPARTMENT—J R M O (female unmarried) for Hull Municipal Maternity Home and Infants Hospital Salary £100 p.a

The fourth group of cases were those in which there had clearly been negligence, but the negligence was not that of the doctor Until comparatively recently it was accepted by the law and the profession that the doctor primarily in charge of the case was responsible for all that happened Even the anaesthetist had been supposed to be the servant of the surgeon, but now the anaesthetist was regarded as responsible in his own field Medical work entailed increasingly the co-operation of a team, and a team suggested a body of persons each of whom was trained and skilled in his own part of the enterprise, so that not only the particular task but the responsibility for it could be delegated to him or her One of the most common examples which had come into the courts was the leaving in of swabs or instruments after operation Whereas everyone would agree that no surgeon could be exonerated from seeing that the theatre sister was properly trained in her duties, the surgeon was entitled to rely upon her for her specific performance In the High Court as yet there had been no case in which the responsibility of the person to whom the surgeon had delegated a particular duty had been upheld, a ruling in the South African courts (Van Wyk v Lewis, 1929) was not, of course, binding in this country Another example was the burning of the unconscious patient by hot-water bottles on being returned to bed after operation Everyone would agree that the sister of the ward or the nurse in charge of the patient should be relied on to see that obvious precautions had been taken To medical men it was distasteful to throw the blame, however deserved on shoulders weaker than their own, but if these cases went into courts of law it was carrying quixotism a little far to say that though there be a legal defence the medical man must not avail himself of it

Mr Gould concluded with some advice There were pitfalls in medical practice, and care and still more care must be exercised Doctors should beware of telling a patient how blameworthy they felt, the patient was often quite nice about it at the time, but on reflection and perhaps after a lawyer had spoken to him, he might take advantage of the admission The doctor should be careful not to criticize in front of the patient or his friends the treatment which another doctor had provided And at all costs the medical man should join a medical defence society

Mr C T LE QUESNE, K C, said that from a strictly legal point of view the possible defences for a medical man charged with negligence might be summed up under three heads (1) It is quite true that something wrong was done, but I did not do it" This was the successful defence in the case of Crotch v Miles (*British Medical Journal* 1930, **1**, 620), concerning a forceps left in the wound (2) It was not negligence at all I did the thing with which I am charged, but I deny absolutely that it was negligent" That case would arise when there was a difference of opinion among medical men as to the correct procedure When the question lay between a specialist and a general practitioner he imagined that the law might reasonably require one standard of judgement from a general practitioner and a somewhat different one from the specialist (3) "The thing did happen, and perhaps it ought not to have happened, but I am not responsible and someone else is" The provinces of the surgeon, the anaesthetist, and the trained nurse were all separate though all were associated in the operation, but there would always be borderline cases where it would be difficult to determine the responsibility He imagined that any court would uphold a surgeon who said, "If I am to perform the operation successfully I must not be bothered with such questions as the whereabouts of the hot-water bottle"

Discussion

In a general discussion Mr W MCADAM ECCLES said that at the time when some like himself began surgery they felt themselves to be responsible for everything in the operation theatre, but times had changed, team work had assumed greater importance, and some responsibil must attach to each member of the team At the sar time it had become so much the habit of the old surge to assume a general responsibility that he was able detect instantly any failure to carry out an expect procedure, and for his own part he never left a nurs home without making sure for himself that there w nothing in the bed that was likely to injure the pati Mr G B WOODD-WALKER referred to charges of neg gence concerning fractures, or possible fractures, and t unfortunate results which might follow if an ignorant a disgruntled patient was allowed in the out-patient depa ment to handle the notes and reports of x-ray and oth examinations relating to his case Dr RICHARD PERRI asked whether the doctor was negligent who, unsuspe ing that his patient had suicidal tendencies, left in l room a dozen tablets of, say, medinal, with instructio to take two

Mr V B GREEN-ARMYTAGE referred to the questi of maiming, and mentioned a case in which two de mutes, husband and wife, being intelligent persons a not desiring to transmit their defect, applied that t wife's tubes should be tied One London hospital refus the application on the ground that their gynaecologist, he performed the operation would be guilty of maimi and liable under the law, but another London hospi undertook the case without question Mr D H KITCH (barrister-at-law) said that in assessing the responsibil of the surgeon for the action of the nurse the questi was surely whether he had been present to super what she did, or could by taking reasonable care ha remedied the position He did not think there had b a "hot-water bottle case" in this country, but there w one in Canada in which the patient got damages agai the hospital, not against the surgeon The PRESIDE remarked that he himself had been the defendant in "hot-water bottle case" in which, by the action of th nurse, a small burn was caused on the knee of the patient But the Lord Chief Justice stopped the case and gave judgement in his favour Dr H H SANGUINETTI re ferred to the famous Hadwen trial at Gloucester in 1924, turning on the responsibility of the practitioner for taking a swab in a case of diphtheria as an instance of how uncertain were the duties expected of a practitioner in a given set of circumstances Dr HOWARD STRATFORD said that the question of x-ray examination was raised not only in cases of suspected fracture but of suspected pulmonary tuberculosis If a person was examined fo suspected tuberculosis and pronounced free and tuber culosis developed later the examining practitioner might have to meet a complaint that he should have added x rays to his other methods of examination Dr G SLOT referred to the question of notifying infectious diseases Many years ago, called in to see a child in a Paddington basement he suspected diphtheria and signed the case up as such A month later he received a solicitor's letter demanding £30 damages It appeared that another doctor had been called in who had said that the case was not diphtheria, but meanwhile, as a result of his notification, the house had been fumigated and the man kept from his work Dr Slot referred the matter to the Medical Defence Union, and the demand for £30 was turned into a letter of apology But the question of infectious disease was really very difficult, and it would be interesting to know how much negligence was concerned if the doctor missed one of the more easily "missable" infections

---

The British Association for the Advancement of Science will hold its annual meeting this year at Nottingham from September 1 to 8, under the presidency of Sir Edward Poulton Among the sectional presidents are Dr G W C Kaye (mathematical and physical sciences), Dr F L Pyman (chemistry), Professor F A E Crew (zoology), Professor P Sargant Florence (economics), Dr J H Hutton (anthropology), Dr E P Poulton (physiology) Dr Mary Collin (psychology), and Mr H G Wells (education)

ALECK BOURNE L T BOND AND K A McGARRITY NEW TREATMENT FOR CHRONIC LEUCORRHOEA

FIG 1.—Low power Four hours after treatment Three zones the inner showing fixation by zinc chloride the middle of coagulation necrosis and the outer of early leucocytic infiltration

FIG 2.—High power Four hours after treatment Thrombosis of blood vessels in area affected by zinc chloride and preservation of histological structure

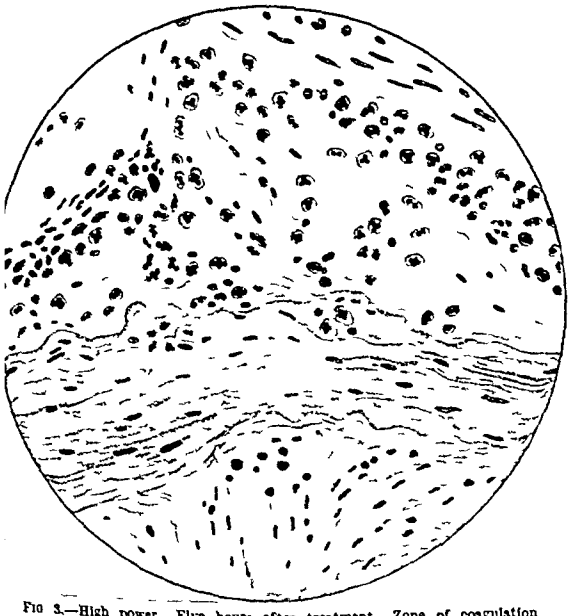

FIG 3.—High power Five hours after treatment Zone of coagulation necrosis and early leucocytic infiltration round the periphery

FIG 4.—Low power One week after treatment Area of dense cellular infiltration at the periphery not penetrating the zone of coagulation necrosis which is the line of future separation of the slough

the adjoining institution occupy a site of about eight acres The buildings were erected at various periods between 1870 and 1900 Since its transfer to the L C C on April 1, 1930, the hospital has been "appropriated"—that is, it has been taken out of the scope of the Poor Law and is, so far as its accommodation permits, available to all residents in the county of London During the quarter ended September 30, 1936, the average daily number of in-patients was 413 Since 1930 new accommodation has been provided for the maternity and gynaecological sections, and a pathological laboratory to serve a group of the Council s general hospitals has also been provided at St Mary Abbots Hydraulic lifts have been replaced by modern electric lifts, the two laundries which formerly served the needs of the hospital and institution have been combined and modernized, and other works of improvement are in hand The Council is also proceeding with the adaptation and reconditioning of the institution buildings (which will be used for hospital purposes) in order to render them suitable for the accommodation of sick persons

The Scientific Instrument Maker

Three floors of the Imperial College of Science at South Kensington were occupied during the first week of the New Year with an assembly of scientific instruments The occasion was the twenty-seventh annual exhibition of the Physical Society Two of the floors were given up to a trade section, and the third to a research and experimental section, to which the National Physical Laboratory largely contributed, but so many commercial firms now undertake research and experiment on a generous scale that the distinction is difficult to maintain Amid instruments of all kinds, some of them belying in the unwieldiness of their names the symmetry and precision of their action, the microscope retained its pride of place Probably there were more microscopes on view than instruments of any other kind, indicative of the place which microscopy and photomicrography have taken, not only in medical and biological applications, but in general scientific and industrial work and research One feature was a double microscope for micro-dissection In physiology, when micro dissecting operations have to be carried out, it is often difficult for one person to do the whole of the manipulation alone Some ingenious inventor has accordingly devised an arrangement enabling two binocular microscope bodies to be placed simultaneously back to back so that two workers can view and operate on the specimen at the same time Next to these instruments for extending the human eye were instruments for intensifying the human ear The sense of hearing, to judge from the instruments provided, seems to be increasingly appreciated No doubt in time the prejudice against wearing hearing-aids, long since outworn in the matter of spectacles, will disappear Some of the hearing-aids were very inconspicuous, notably one light-weight portable apparatus, embodying a carbon microphone, developed in the department of the education of the deaf at Manchester University Making the deaf hear is not a simple matter of amplification of sound, and one firm specializes in automatic volume control in deaf-aid amplifiers This control limits the sound output of the instruments to a degree tolerable to the user, and the distortion due to overloading of the output valve with loud sounds is prevented In modern civilization the suppression of unwanted noise is at least as important as the amplification of desired sounds, and as a step to noise elimination and control there were noise meters on view one of them designed to meet the requirements of the Air Ministry for the measurement of noise in aircraft but capable of being used for other purposes also Several examples of diathermy and short-wave apparatus were shown portable and fixed, also a portable cardiograph with a camera having a continuous spool of paper driven at speeds from 20 to 80 millimetres per second Another interesting device was a fluoroscope, a portable instrument designed in collaboration with the Home Office for medico-legal and other investigation

Correspondence

Serum for Influenza

SIR,—On analogy with other virus diseases such as measles it seems reasonable to assume that serum obtained from patients convalescent from influenza might be of therapeutic benefit The suggestion was, we believe, first put forward by Dr Herbert French in 1919, but has never been practised, at any rate on a large scale The recent researches of Laidlaw on the transmission of influenza to ferrets have shown that the creatures do in fact develop antibodies as the result of an attack This would be a strong point in favour of the use of convalescent serum were it not that after a few months of immunity they become again susceptible, even though antibodies are still in the blood Possibly, however, protection depends in part upon these substances and upon their degree of concentration in the body

Our purpose in writing this letter is to ask those medical men who are now dealing with influenzal patients to obtain blood from them when they are convalescent If they will send either the blood or preferably the patient to the bacteriological department, Guy's Hospital, a batch of mixed sera will be obtained and treatment of influenzal patients carried out with the usual controls It is hoped in this way to decide whether the serum is of any value, and if so to aim at the collection of large supplies so that we may at last have some substance of definite therapeutic and prophylactic value to guard the population against future epidemics Will those doctors who are good enough to collaborate in this manner kindly select only those patients in whom the diagnosis of influenza was unquestionable and preferably uncomplicated? Blood may be collected into a sterilized vessel by any of the recognized aseptic methods of venepuncture

Instructions for Collection of Serum—If apparatus is not to hand, on receipt of a message at Hop 1654 collecting apparatus will be sent to any medical man offering to send blood This will consist of a sterilized needle and rubber connexion fitted to a sterilized 250 c cm screw capped bottle The skin over an arm vein should be carefully cleaned, the vein distended by pressure higher up the arm, and venepuncture performed in the ordinary way, the blood being run directly into the bottle When this is nearly full the pressure on the arm is released, the needle withdrawn, a pad placed on the site of puncture, and the cap screwed on to the bottle The blood should then be sent directly to this department The whole procedure must be as aseptic as possible

If the patient is sent to the laboratory for blood collection a preliminary telephone message to the above number would be appreciated—We are, etc,

Nutritional Anaemia in the East End of London

SIR—I have read with interest Dr Leonard Findlay's article in the *Journal* of January 2 dealing with haemoglobin and red cell estimations in children admitted to the wards of the Princess Elizabeth of York Hospital for Children The subject is, I think, of great importance, and no one would lightly disregard conclusions drawn by Dr Findlay, for whom I personally have a high regard It is therefore with some trepidation that I venture to ask your readers to consider his findings critically before they conclude that widespread iron prophylaxis for infants is superfluous

CONGENITAL PORPHYRINURIA

Among posthumous papers few can have had more interest than one which now appears[1] from the pen of the late Sir Archibald Garrod It was evidently given the subtitle of "A Postscript" by the author himself for the reason that it supplements the accounts published ten years ago of three cases of congenital porphyrinuria Each of these cases which were those of Garrod and Mackey, Gray and Ashby had shown the three cardinal signs of this rare disease—namely a port wine coloration of the urine blistering of the skin on exposure to sunlight (hydroa vaccinforme) and pink or brown coloration of the teeth with the exception that the last of these signs was lacking in one case Full subsequent histories and an account of their present condition had been obtained by Garrod for each patient all were living and aged 14 19 and 30 years The coloration of the urine had persisted unchanged and in spite of every precaution blistering of exposed areas of skin had led ultimately to severe scarring and in one of the patients an eye had been similarly affected In two the general health has been good although in one of them there was well marked enlargement (which has since subsided) of the liver and spleen the third and oldest of the patients has now a fairly severe degree of anaemia with enlarged spleen In none of these three patients is there any family history of the disease the parents of one were first cousins and apparently none of them is married It is much to be hoped that the interest awakened in others by the late distinguished author of this paper in this disease and especially in these patients will not be allowed to lapse

POST-OPERATIVE LUNG COMPLICATIONS

Pierre Duval and Leon Binet[2] have published experimental work to explain the pathogenesis of the group of post operative pulmonary complications not associated with well known causes inhalation anaesthesia venous emboli or dissemination from a septic focus They refer to those which follow operations correctly and aseptically performed in a non septic field under local anaesthesia The work was carried out in an attempt to confirm the idea that the cause of these complications might be the intoxication which follows all surgical interventions from the autogenous albumins (polypeptides which do not cause shock) produced by the operative trauma and disseminated by the blood stream Polypeptides prepared from the muscles of dogs were injected into either the saphenous or the mesenteric veins of other dogs To avoid confusion with lesions that might be produced during death the animals were killed while under basal anaesthesia by bleeding them fifteen minutes after the intravenous injection and the lungs were examined by performing a thoracotomy before death Controls treated in this way showed no lesions The injections were given to normal animals and to those which had previously been sensitized by a subcutaneous injection of polypeptides No lesions were observed in the non sensitized On the other hand in the sensitized animals foci in the lungs were found consisting of dark red zones on the light pink background of the rest of the organ On section they showed all the macroscopic characters of red infarcts Histological examination revealed two types of morbid change (1) typical atelectasis with dilated vessels and (2) alveoli distended with blood (*apoplexie pulmonaire*) These changes correspond to those found in man Finally the authors quote a case which appears to confirm their laboratory results A man died four days after a simple exploratory laparotomy under local anaesthesia with symptoms of lung involvement The histological changes in the lungs were similar to those found in the experiments Moreover two days before death the blood contained 80 mg polypeptides per 100 c cm —nearly three times the normal figure—and 2 grammes of urea

RATIONAL PRESCRIBING

The cost of drugs is a serious item in all hospital budgets and examination of these costs usually reveals a wholly disproportionate expenditure on flavouring agents and on expensive proprietary drugs for which official equivalents are available The London County Council has endeavoured to lower these unnecessary costs by issuing an *L C C Pharmacopoeia* for use in its general and special hospitals[1] This is a pocket volume of 279 pages most of which is occupied by a list of drugs and formulae This list contains about 1 500 titles and comprises all the pharmaceutical preparations in the *British Pharmacopoeia* selected preparations from the *British Pharmaceutical Codex* and a number of special formulae The latter have been compiled with a rational regard for simplicity combined with efficacy and errors such as redundancy in flavouring agents have been avoided For example iron and ammonium citrate mixture contains an effective dose of the iron salt (30 grains) and water to 1 fluid ounce This is in pleasing contrast to the familiar prescriptions which so often combine an insufficient dose of iron with a large array of expensive flavouring agents The last quarter of the book provides a variety of data and information Useful features that deserve special mention are instructions on methods of administering drugs on the collection and forwarding of material for chemical investigation and on such clinical procedures as the giving of test meals Clear directions of this kind should do much to reduce waste of time and labour in clinical laboratories The only criticism that occurs to us is that the list of drugs and formulae is unduly long and it certainly contains some substances of very doubtful efficacy but experience gained from the use of the *L C C Pharmacopoeia* will probably lead to a good deal of pruning for subsequent editions Sir Frederick Menzies in an introduction claims that this pharmacopoeia is probably *the most comprehensive* and up to date of its kind The volume is offered for sale to the profession at the very low price of 1s 6d it deserves wide popularity not only for the mass of useful information it contains but also because it is based on rational conceptions of therapeutics

[1] *London County Council Pharmacopoeia* P S King and Son (1s 6d)

cancer have suffered from the delusion that cancer and embryology can somehow be made to explain each other But really cancer and tissue from the embryo are as the poles asunder The embryo is an epitome of biological history and contains all the future of the race Cancer cells, on the other hand, are at the end of their tether, they are poor things—somatic cells that have almost run their course They have this in common with embryonic cells they are in a state of rapid division—but no more In contrast with the richness of function in true embryonic cells cancer cells are functionless, in contrast with the virile youth of the embryo they are senile The embryonic cells are designed for rapid division and rapid differentiation, the rate at which they divide is normal to them Malignant cells divide rapidly, contrary to their normal habit Far from becoming more differentiated, descendants of malignant cells tend to lose all trace of differentiation, they retain only the lowest common denominators of living matter—the capacity for division and for absorbing nutriment Therefore it seems to me useless to look to the embryo for an explanation of cancer One must regard cancer as a disease with origin and end peculiar to itself It is no attempt upon Nature's part to commit suicide, but for the fact that it is composed of living cells it has no connexion with the past, its unit is a cell that has lost its memory

In considering the question of a chemical origin for cancer two aspects must be separated from each other (1) growth stimulants—the carcinogenic substances—and (2) internal metabolic derangement of the cell

(1) For growth stimulants to be the sole producers of cancer they must continue to act when the cancer has buried itself in the tissues of its host Down there, carcinogenic products of coal tar (probably so misnamed) can hardly continue to pursue it Where, then can the stimulators come from? There are three possibilities the blood stream, the cancer itself, or the adjacent tissues that are forced to secrete such a substance (i) If the growth stimulant comes from the blood stream one has to imagine some source from which the blood may derive the stuff which must have some function other than the production of cancer It one can avoid these difficulties the question then arises Why is there, anywhere in the body a single cell similar to the original cancer cell, that is not cancerous? (ii) There are two objections to the suggestion that the stimulant comes from the cancer cells themselves First nowhere in Nature do cells primarily secrete substances for their own stimulation Simple organisms depend in the first place directly on external stimulation Complex organisms depend on a chain of internal secretory organs beginning with some controller that is indirectly in contact with the outer world Secondly the chemical growth principle ought to be recoverable from a mass of cancer cells and if the substance behaves like any other principle it ought to increase quantitatively with increasing size of the cancer So, the longer a cancer exists the more likelihood ought there to be of the appearance of many cancers

(2) Does the growth stimulant arise from some internal metabolic disorder in the cancer cell itself? No cell grows or does anything else but die if it be not stimulated to live In life stimulus comes from without, the primordial cell and the latest man are equally designed to fit environment in so far as they are living things If stimuli did not come from without it is hard to imagine how even a unicellular organism could begin to exist The clearest example of what I have been saying is in the physiology of reproduction The Graaffian follicle activated from the outside produces an ovule which, by the action of some other stimulant, is induced to become receptive The sperm cell penetrates to the nucleus and supplies the stimulus that initiates foetal development A living thing like the sperm cell is the only imaginable thing that could thus exercise a continuous stimulation during the whole course of development

There is some evidence from heterogeneous grafts Sooner or later they die out because their normal stimulus to live is not forthcoming, in spite of the most complete vascularization they die

It seems to me that a hypothesis which requires self stimulation on the part of the cell is the most highly improbable that imagination could conceive By its terms Nature is supposed to act as she has refrained from doing during the whole course of evolution It is so far away from probability that one should examine, examine, and yet again examine all other hypotheses before falling back on such a one I would like to make the following suggestions

Cancer is not due to any single principle operating alone, but is the result of a sequence of events acting on cell life First, there is an accelerated growth of cells Whether this is due to direct stimulation from coal tar and the like, to the natural flux of new developing tissue accelerated by an irritant, or to the efforts of an old cellular system to fill gaps left by the destruction of some of its units, is immaterial This acceleration of division I call factor "A" Under the influence of 'A" there will appear from time to time a defective cell factor "B" How is "B" defective? A normal cell protects its own nucleus against the intrusion of extraneous matter, "B" is defective insomuch as it fails in this respect

Factor "B" is now in a medium of dead and dying cells *mingled with organisms* Out of the hurly burly, in the manner of a sperm cell, something enters the defective cell, pushes its way through the cell body, and reaches the nucleus This something I call factor "C" 'C" may be (1) represented by a conjugation of two more or less similar cells (as suggested by Drs McKillop and Duhig of Brisbane), (2) a detached but viable chromosome, (3) a living *micro organism* The result of this intrusion may be one of three things (*a*) the cell is killed, (*b*) the intruder is killed, (*c*) neither may be strong enough to kill or weak enough to die, an uneasy partnership resulting In this case the cell is potentially a cancer

Enter factor "D," the body resistance of the prospective host The elective cancer must defeat factor "D" Defence in the end must be effective more or less according as the differences between normal body cells and invading cells are more or less marked As is well known, bacteria evoke a profound and persistent reaction of the defensive apparatus, in protozoal infection the defence is less energetic because the invader is not so definitely marked off from the cells of its host There is such little difference between cancer and the body cells that, in this disease, the defensive effort needs to be carefully looked for in order that the observer may be aware of it at all Now the defective cell, invaded by "C," which has slipped past factor "D," holds the field The new nuclear companionship, a pseudo-conjugation, is, as I have suggested, an uneasy state of affairs Each party inflames the other, a nucleitis, transmitted from each generation of cancer cells to the next, spurs on the rapid and anarchistic division—I am, etc,

Brisbane, Dec 8, 1936 WILLIAM P KELLY, FRCSI

Malignant Disease of the Pharynx

SIR,—I was much interested in Mr Robin Pilcher's article on the diagnosis of malignant disease of the pharynx (*Journal*, January 2, p 13), and there is no doubt about the neglect in the making of an early diagnosis A busy surgery like an overworked out-patient department is not conducive to good work, and this may account for the practice of prescribing gargles instead of attempting to use a laryngeal mirror His remark on the part played by oral sepsis in its association with malignant disease of the pharynx is very important, and I am rather surprised to see him leaving out the definite picture of "a mouth like a cesspool with a plug of cotton wool in the ear" How many ears are syringed to cure the earache

be aroused The various guises under which adult myxoedema can present itself must be remembered for it will be found that such cases often come to the gynaecological or other special department with symptoms indicative of local disease

If confirmatory evidence of thyroid deficiency is required a basal metabolic rate test can be carried out This test in thyroid disease corresponds in value to the blood count in anaemia If it is below the normal level with clinical symptoms of hypothyroidism the diagnosis is assured In the very young the performance and interpretation of the basal metabolic rate test is difficult In juveniles and adolescents it can be carried out without difficulty In young children valuable confirmatory evidence of hypothyroidism can be obtained from radiological examination of the carpus, for the ossification centres are late in appearing and typical delay will be found

Course and Prognosis

The results of treatment of cretinism and myxoedema are on the whole satisfactory

In cretinism much depends on an early diagnosis and the institution of thyroid therapy at the earliest possible stage The results of thyroid therapy on the growth defect in cretinism are most satisfactory, provided that treatment is begun early Under these conditions the physical standards reached compare favourably with the normal It is more difficult to assess the possibilities of improvement in the mental sphere If treatment is begun late mental development may remain much below the normal, and the years lost before treatment is instituted may never be regained It is probably true to say that the improvement in mental development is seldom as great as in the physical sphere although examples could be quoted in which standards above average have been attained The defects in sex development can be corrected by thyroid therapy and with successful treatment the changes of puberty will occur at the normal age or very shortly afterwards In females the menstrual cycle can usually be satisfactorily established

The prognosis in adult myxoedema is good and the clinical results of thyroid treatment are most satisfactory In the course of about six weeks it can be predicted that the myxoedematous changes will have entirely disappeared and the patient be restored to his or her former condition

In both cretinism and myxoedema it is essential that the patient should continue treatment throughout life

Treatment

The therapeutic indications in the treatment of cretinism and myxoedema are clear The basal metabolism of the patient must be brought to the normal level and there maintained by an appropriate daily dose of thyroid extract given by the mouth In practice it is not always possible to have estimations of the basal metabolic rate carried out, and in the ordinary straightforward case it is certainly not necessary An initial estimation however will be of considerable value and will give a good idea of the amount of thyroid extract which is likely to be required To a large extent the basal metabolic rate runs parallel with the pulse rate so for ordinary purposes the latter will usually be a sufficient guide especially if it is used in conjunction with clinical data particularly variations in the patient's weight

Most cases of cretinism and myxoedema are extremely sensitive to thyroid extract so it is best to begin with a small daily dose and gradually increase it at intervals of a week or so until the appropriate maintenance dose has been found This fractional method of introducing thyroid treatment gives good results and avoids any risk of overdosage in the early stages The problem of dosage is almost identical in childhood and adult hypothyroidism The usual method is to start with 1/4 grain of a desiccated extract once a day, increasing to 1/4 grain twice a day at the end of a week 1/2 grain twice a day at the end of another week and later to a total of 1½ or 2 grains daily For a cretin a sufficient maintenance dose of thyroid extract is usually 1 to 1½ grains a day but the dosage varies to some extent with the age of the individual The maintenance dose for a fully developed case of myxoedema is usually about 1½ to 2 grains a day of a desiccated thyroid extract A larger dose is seldom necessary It must be pointed out however that it is only possible to judge by results and no hard and fast rules can be laid down Adult patients often rapidly acquire a knowledge of what is the optimum dose for them and can give considerable help to the physician They should be warned at the start that treatment will have to be continued throughout life and that successful results depend to a large extent on the systematic supply of thyroid extract in the correct dosage Since the effects of the remedy are so obviously beneficial there is seldom any difficulty in obtaining complete co-operation from the patient

This slow method of introducing thyroid treatment is suitable for ambulatory cases If quicker results are required the patient should be put to bed and in these circumstances the increases in dosage can be made at shorter intervals The usual method when the patient is in bed is to make 1/4 grain increases every other day until the full maintenance dose has been reached

Overdose of Thyroid Extract

A warning is necessary as to symptoms of overdosage and thyrotoxaemia and I would draw a distinction between the two The ill effects of the former usually pass off quickly on withdrawal of thyroid but the effects of thyrotoxaemia are more lasting When this complication has occurred in my experience it has usually been due to the presence of a septic focus or to taking thyroid extract during an infective illness such as influenza or tonsillitis This usually results in a persistent tachycardia with other signs of cardiovascular disturbance and the individual loses weight as he does when suffering from thyrotoxaemia of other forms In view of the possibility of this complication arising it is therefore a good rule when instituting thyroid treatment first to make sure that all septic foci have been dealt with and secondly to warn the patient to discontinue treatment if any such eventuality arises The risk of overdosage can best be overcome by stopping the routine administration of thyroid for a day or two each week or for a few days each month to obviate any cumulative effects If overdosage does occur all thyroid should be stopped for a week or two and started again at half the previous dose It is not difficult to detect overdosage at an early stage as when myxoedematous symptoms have once been controlled the weight should remain more or less constant at approximately the normal level Any tendency to lose weight below the average normal especially if there is tachycardia and undue nervousness should be regarded with suspicion

A note is perhaps necessary as to the different preparations of thyroid extract in general use though only two require serious consideration—the fresh gland and desiccated or dried gland extracts The latter are five times

In regard to Dr Blair's patient gradual improvement took place and at the end of ten weeks he was able to go away for a change of air, and he was not seen again "Each time the urine was examined albumose was present in considerable quantity" I have little doubt that the supposed 'albumose" precipitate was not of Bence-Jones protein, but only of urates, as in the recent case I mention —I am, etc,

London, W1, Jan 8 F PARKES WEBER

Metabolic Factor in Rheumatism

SIR,—I read Dr R G Gordon's article in the *Journal* of December 19, 1936 (p 1243), with great interest It was refreshing in these days of scepticism about "focal sepsis" to find that he "would deprecate an abandonment of the orthodox search for a focus of infection"

Briefly, it would appear that there are only three rheumatic conditions in which he is of opinion that a focal infection may be of aetiological significance—namely, spondylitis ankylopoietica, true rheumatoid arthritis, and certain cases of fibrositis The question as to whether there may or may not be other forms of rheumatism in the production of which focal sepsis plays a part is too controversial to go into in detail here, suffice it to say that of past years the question of focal sepsis has been ridden to death, with the result that it has fallen into considerable disrepute The actual causes for the odium with which it is regarded in many quarters will generally be found to be (1) slapdash methods of investigation, resulting in (2) lack of precise localization, with consequent (3) indiscriminate operative procedures, and lastly (4) the difficulty of eradicating an infective focus when found

It is neither scientific nor logical to discard a line of investigation which may result in benefit to the patient just because it has proved useless in certain cases though of use in others, or because the object of such investigation when found proves in many cases to be difficult of eradication Strong enough emphasis cannot be laid on the fact that the search for a septic focus must be thorough It is not justifiable, for instance, to assume that the tonsils must be to blame just because they look unhealthy or because pus can be expressed from their crypts, or even because haemolytic streptococci can be cultured from them Many of us must have seen rheumatic cases in which tonsil enucleation has been performed, but in which instead of an improvement an actual aggravation of the patient's condition has resulted Probably the explanation is that the tonsils had become secondarily infected from a primary focus in a paranasal sinus while doing their best to exercise their protective function and that with their removal the sinus focus has been given ample unbridled opportunity to produce its undesirable results In all such cases, therefore, most careful investigation of the paranasal sinuses should be carried out and it is only in the definite absence of any evidence of a septic focus in their intricate system of cavities that the tonsils should be touched, while if such a sinus focus is found it should be adequately dealt with before tonsillectomy is even to be considered

Again the mere failure to find profuse purulent discharge by anterior or posterior rhinoscopy does not justify the assumption that the paranasal sinuses are perfectly healthy for what, after all, does the finding of frank pus signify? Surely merely that the patient's reaction to a sinus infection is vigorous and that the particular sinus ostium is patent I would go further and suggest that where the search for a septic focus is indicated the very failure to find pus demands that a most detailed investigation should be carried out, and the following brief outline shows the further procedure to be adopted

A—Examination of the pharynx may show a well marked ciliary stream on one or other side

B—Nasal endoscopic examination should be made, as recommended by Dr P Watson-Williams The following may be found (1) congestion near the mouth of a sinus, (2) a group of small polypi in the same region, (3) a vascular leash in an atypical position (4) Oedema of the middle meatus, (5) thin ropes of secretion stretching from one or other turbinate to the septum, choanal margin, Eustachian cushion, or to each other, (6) a stream of purulent discharge coming from superior or middle meatus or from the sphenoidal ostium Negative findings indicate repetition of the procedure after a few days' interval

C—Radiographs should be taken, preferably in the Graham Hodgson positions

D—If the findings to date are suggestive suction lavage of both antra, posterior ethmoidal cell groups, and sphenoidal sinuses should be carried out and samples of the sinus washings sent for bacteriological examination

E—Lastly, if the bacteriological findings are positive in any sinus or group of sinuses the Lowndes Yates dye test should be performed to determine whether the suspected sinus or sinuses are giving rise to toxic absorption, or whether fibrotic changes in the sinus mucosa are protecting the organism against auto intoxication from it

It is only after the various stages of the above exhaustive investigation have been completely run through with negative results that it is permissible to say that no septic focus exists in the paranasal sinuses, and that therefore if any toxic focus is responsible at all it must be situated in the teeth, tonsils, or intestinal tract

A further point is this When one considers that in the early stages of a sinus infection the organisms lie on the surface of the mucosa but with the passage of time burrow ever deeper till they gain the lymph spaces and so eventually the blood stream, it is surely not difficult to suppose that when they enter an area where recent traumatism or strain has lowered the local resistance they tend to settle there and establish, as it were, secondary infective foci, around which proliferation of fibrous tissue occurs with nodule formation The removal of the original primary toxic focus will not clear up these secondary foci, and it is advisable, when other methods of treatment such as those outlined by Dr Gordon plus removal of the primary focus have failed to cause certain of the painful nodules to subside, to inject them directly with lipovaccine, as recommended by Dr Laughton Scott in the *Journal* of February 15, 1936 The results are said to be in many cases satisfactory and lasting—I am, etc,

Bath, Jan 4 C A HUTCHINSON

Treatment of Prostatic Obstruction

SIR,—I was much interested in the article by Mr J Cosbie Ross on prostatic obstruction, which appeared in the *Journal* of December 26, 1936 (p 1297) With most of his remarks I agree, but there are some open to discussion I am pleased to note that he considers routine cystoscopy necessary in all cases presenting prostatic symptoms, a procedure which I have always emphasized, but he makes no mention of routine posterior urethroscopy, which is even of more value Cystoscopy alone gives no picture of the prostatic urethra, it merely delineates the appearance of the vesico-urethral orifice Many cases of prostatism reveal no abnormality either on rectal or on cysto-

also pointed to one of the weaknesses in the physical educational system in that, while every other specialist master in the academic field could reasonably aspire to a headship, the physical instructor could not do so and thus recruiting in this branch of the teaching profession lacked encouragement. Dr ATTLEE raised the question whether there was any danger of getting people so thoroughly fit that they failed to adapt themselves to modern conditions. Dr MORLEY drew attention to a possible fallacy in recruiting statistics on which wrongful impressions as to national decadence might be based. A wholly wrong idea as to the physical fitness of the male population of the country at the time of the war was derived from the recruiting statistics showing a large percentage of rejections. The fact was that the rejected men were summoned before the medical boards time after time, and as the war went on the standard of acceptance was lowered with the result that the man who had at first been put in a low category was placed higher and higher, and at last perhaps passed for active service. But in the returns this man might account for half a dozen units in the total of unfitness, whereas the fit man was only counted once.

Dr LE FLEMING while acknowledging inevitable overcrowding in the classrooms, was still of opinion that the real trouble and the remedy lay in the dormitory. With regard to recruiting in view of the fact that the record of the types of men who sought to enlist in the Army showed a steady fall, it seemed to him that no other deduction was possible than a lowering of the physical standard of the nation.

THE RED CROSS IN SPAIN

A memorandum from the International Red Cross Committee at Geneva states that thirty-five national Red Cross societies (including the British Red Cross Society) have now contributed to the relief of the sufferers in the Spanish civil war their donations amounting to 459 398·48 Swiss francs of which over 350 000 has come from South America. All these gifts are made unconditionally and without distinction and are administered by the International Committee with its traditional impartiality. The sums received have made it possible for medical supplies for the treatment of wounded on both sides to be sent in increasing quantities.

Information bureaux have been established at a number of centres and over 50 000 queries have already been forwarded to Geneva for solution and in addition delegates of the International Committee working with local personnel are working at Madrid, Valencia, Barcelona, Burgos, Santander, Bilbao, San Sebastian, Alicante, Seville, Saragossa and Palma de Majorca. Special data are being collected on the subject of orphans and arrangements are in train for their future care. The committee's delegates have been authorized nearly everywhere to visit the prisons and agreements have been established whereby the release of women, children, boys under 18, adults over 60 and invalids has been secured. The delegates have encountered a promising spirit of co-operation on both sides but a good many difficulties arise in carrying out the letter of the agreements. Efforts have been made to secure the establishment of a neutralized zone in Madrid as a refuge for the non-combatant inhabitants.

A most serious problem faces those concerned with the relief of suffering in Spain—that of revictualling. Certain commodities such as coal are already scarce, rationing and food cards are being instituted and the question whether the Red Cross can undertake the supply of a minimum of the necessities of life at least to certain categories of the population—women, children, invalids and prisoners—is under consideration. The sums required would far exceed those received up to the present and so far the most that can be attempted is the supply of a few parcels of food and condensed milk to sick prisoners.

Donations to the Red Cross Spanish Relief Fund may be sent to the Director General, British Red Cross Society, 14 Grosvenor Crescent, London, S.W.1.

AN INFLUENZA EPIDEMIC IN THE FALKLAND ISLANDS

BY

R. L. CHEVERTON, M.R.C.S., L.R.C.P.

Senior Medical Officer, Falkland Islands

An epidemic of influenza which broke out in the Falkland Islands during the winter of 1935 is of interest from several points of view as showing: first, the effect of limited communications in an isolated group of islands upon the spread of disease; secondly, a peculiar latent period between the primary cases and the general outbreak of infection; thirdly, a well-defined period of incubation; and lastly, the influence of sudden climatic changes, chiefly a change of wind to the south with its concomitant weather, upon the outbreak of the disease.

Geographical Situation and Climate

For better understanding of the spread of the epidemic some knowledge of the Falkland Islands is necessary. They lie in the South Atlantic Ocean about 300 miles to the east and somewhat to the north of Magellanes in the Straits of Magellan between latitudes 51 and 53 degrees south and longitudes 57 and 62 degrees west. In addition to the two main islands which are known as East Falkland and West Falkland and are separated by the Falkland Sound there are about two hundred smaller islands clustered about within a space of 120 by 60 miles. The total area of the Islands is 4 618 square miles. The entire country is of a wild hilly moorland nature. The soil is chiefly peat or clay with areas of sandy outcrops. Trees are absent and the general appearance of the country is bleak and inhospitable.

The mean average temperature is about 36° F. with a mean maximum of about 46° and a mean minimum of about 34°. The average rainfall is only twenty-six inches but the air is very damp. During the summer months the constant high winds become very trying and in winter, which lasts about eight months, the lack of sunshine has obvious deleterious effects. The inhabitants of the place totalling 2 432 are of European stock, many being of Scottish descent due to the importation of shepherds from Scotland. Owing to the lack of communications both within the Islands and with the outside world and to the distance from the Home Country intermarriage with its accompanying results is very common.

As there are no roads outside the town the only means of communication overland is on horseback. All the farmsteads or settlements as they are called locally are situated on the seaboard and small steamers or cutters call every few months to bring out mails and supplies or to pick up wool. As in all isolated communities infectious diseases spread very rapidly so far as lines of communication will permit.

The chief, and in fact the only industry of the Islands is sheep farming so there is only one small town—Stanley the seat of government—which is situated in the East Falklands. The principal local trading company owns a vessel—the s.s. *Lafonia*—which calls at Monte Video for mails and at Magellanes for timber and coal. Four times a year a cargo boat whose last port of call is Bahia Blanca in the Argentine calls at Stanley.

Source of the Epidemic

It is thought that the epidemic in question was brought from the coast in the following manner. While crossing to Magellanes in August 1935 one of the crew of the s.s. *Lafonia* had a cough; in Magellanes he visited a relative's house in which certain persons were suffering from la grippe. On subsequent inquiry from the British consuls this disease was found to be very prevalent in Magellanes and to a lesser extent at Bahia Blanca between the middle of July and the middle of September

after the introduction of this "combined" system, is one whit inferior to that of any other medical school But my experience of five years' teaching of clinical medicine in Edinburgh when this modification was in vogue convinced me that the change could not be regarded as a beneficial one It tended, if anything, to aggravate the cramming system so prevalent in medical education to-day, and, in general, to foster a type of medical education which is out of touch with modern requirements

The few years' experiment in Edinburgh has, however, been a useful one, and will have fulfilled a useful purpose if the limitations to its success are fully recognized The more effective co-ordination of modern medical teaching on the lines stressed by the British Medical Association is in my view, the greatest medical need at the present time Too much attention can be focused on mere "academic co-ordination" to the exclusion of "practical co-ordination" of a kind calculated to arouse and sustain the intelligent interest of the student It is, I think, a good omen that many of the present Edinburgh teachers are alive to these needs—I am, etc,

CHALMERS WATSON, M D

Fenton Barns, Drem Jan 5th

Diphtheria Immunization

SIR,—Dr Bousfield puts me to the trouble of writing to explain what I mean by the term "anaphylaxis"

Anaphylaxis is a state of supersensitiveness to the action of a foreign protein brought about by the previous introduction of that protein (sensitization) As to Dr Bousfield s hundred thousand series, in which many of the children had had a previous introduction of that protein and yet there was no anaphylaxis—well, I can only say that such does not make sense For the term "anaphylaxis" arose originally out of the very numerical experience which Dr Bousfield relates as his Anaphylaxis may be inherited or acquired Asthmatics, children of asthmatics, children of the lymphatic (status lymphaticus) type, and those associated with horses are particularly to be watched If anaphylaxis is to be so easily explained away as Dr Bousfield does, what is the reason for testing for hypersensitiveness and for the treatment of the preparatory kind by desensitization, known to all G P s? —I am etc,

Athenry Co Galway, Jan 2 C H FOLEY, M B

Surgeon's Liability for Nurse's Negligence

SIR —The medico-legal article in your issue of January 2 deals with a subject on which I wish to make some comments and a suggestion

In Crotch *v* Miles (*British Medical Journal*, 1930, **1**, 620) Sir Hugh Rigby said in evidence that the theatre sister is a highly skilled person "responsible for the instruments and their sterilization, the towels and the swabs and that the duty of counting instruments and swabs falls according to the usual practice in this country, on the theatre sister' This expression of surgical opinion makes a clearly defined division of responsibility as between surgeon theatre sister, and, by inference, the whole of the theatre staff, and it is a source of satisfaction that this principle has found admission by the law in the case of Ingram *v* Fitzgerald

In surgical practice in the operating theatre and elsewhere the division of duties and the division of responsibilities are clear-cut Fuller reference to these duties is made in a letter published in the *Law Times* of June 15, 1935 A comparison may be made with an air service, where the division of duties—and responsibilities—between the pilot and the ground staff is also clear-cut But this principle does not appear to have met with universal recognition in the eyes of the law, or how could Lord Hewart, in Crotch *v* Miles, have pointed out that the jury must ask themselves whether the surgeon on the day in question ought personally to have counted the instruments, or whether he was entitled to say that it was the job of the skilled theatre sister, and that he was entitled to act on her report? There is little doubt as to what answer would have been returned to this question by a body of doctors or nurses familiar with the usual practice But what answer, if any, was given by the jury, unfamiliar with the usual practice, your commentator does not state

No surgeon believes that in relying on the theatre sister for the count of instruments and swabs and for other technical services, and on the theatre staff for their duties he is transgressing the law But if in law he is not entitled so to rely in the cases which go wrong, and about which legal action is taken, so equally he transgresses the law in so relying in the thousands of surgical operations whose records never see the light of day in the law courts

A writer in the *Law Times* of March 28, 1936, under the title "Doctors, Surgeons, and Patients," gave the impression that we must be content to leave this matter in uncertainty pending a full-length decision of the House of Lords, but I suggest that a statement of the medical view on the division of the duties and responsibilities as between surgeons and nurses, if compiled and published by the British Medical Association, must carry weight when cases of this nature are considered and decided in courts of law—I am, etc,

Worthing, Jan 6 C GIBSON

*** We have referred Dr Gibson s letter to our medico legal correspondent, whose reply follows—ED, *B M J*

In Crotch *v* Miles the jury decided the case on other grounds that the forceps had not been left in at Mr Miles s operation at all They therefore did not have to express an opinion on whether Mr Miles was entitled to rely on the word of his theatre sister Dr Gibson should not assume that the decision in Ingram *v* Fitzgerald (which is in any case binding only in New Zealand) lays down any far-reaching principle of law, it only decided that in the particular circumstances the surgeon was not responsible for the negligence of the nurse who painted the patient with iodized phenol instead of tincture of iodine When a surgeon relies on his theatre staff to perform their allotted duties he does not transgress the law, because there is no principle or enactment of law which forbids him to do so Prima facie, however, since he is in charge he is liable for any damage which may result to the patient from the negligence of one of his team, though he may in certain circumstances, as in the New Zealand case, be able to show that in those circumstances the nurse was carrying out a duty for which she alone, and not he, could be properly held responsible The point is that, in the present state of the law the surgeon is not automatically discharged from all liability for the acts of his theatre team, and the court will always scrutinize the particular circumstances and ask the question whether, in these circumstances, he could have been expected to exercise personal supervision or not This is probably one of the many instances in which law does not truly reflect the universal practice It could only do so

outbreak and several relapses in Stanley, so September 3 and 17 are the dates chiefly to be noted, points of significance are

1 Both tables show a drop in the barometer readings forty-eight hours before the outbreaks

2 Both tables show an appreciable drop in the maximum temperature forty eight hours before each outbreak followed twenty four hours later by a rise which continues until twenty four hours after the outbreaks

3 Both tables show a drop in the minimum temperature three days before the outbreaks—that is on September 2 and 16 In Table I the temperature falls until the actual date of the outbreak—September 5—when it rises sharply In Table II there is a slight rise in the temperature forty eight hours before the outbreak followed by a sharp fall twenty four hours before and a slightly sharper rise on the actual day of the outbreak—September 19

4 Both tables show a south easterly wind forty-eight hours before the outbreaks This wind has a very bad reputation locally as being cold penetrating and damp

5 Both tables show increased rainfall forty eight hours before the outbreaks

6 Both tables show very low recorded sunshine forty eight hours before the outbreaks

It is difficult to resist the conclusion that these climatic variations had some influence upon the epidemic in ending the strange latent period before the outbreaks on the East and West Falklands on September 5 and in leading to the second outbreak in Stanley on September 19

Reports of Societies

RENAL TUBERCULOSIS

At a meeting of the Section of Surgery of the Royal Academy of Medicine in Ireland on December 18 1936, with MR SETON PRINGLE in the chair MR R ATKINSON STONEY showed a case of late ulnar paralysis, and a modified internal angular splint which he had devised for certain cases of fracture of the surgical neck of the humerus He had found it useful in cases where it was difficult to apply traction with a Jones splint

MR T J D LANE read a paper in which he briefly summarized the pathology, aetiology symptomatology and diagnostic methods employed in the investigation and treatment of the tuberculous kidney The association of the disease with tuberculous lesions in other parts of the body was important and it was pointed out that the leading common symptom, frequency of micturition very often began suddenly, and, except in cases where the ureter was obstructed the urine was always turbid Mr Lane said that in the early case, before secondary infection has taken place a freshly passed specimen of urine was characteristic in appearance The turbidity of the urine was faint white turbidity as if a drop of milk were intimately mixed with a large quantity of water but when mixed infection had occurred the urine though a little more turbid was once more yellow in colour If the urine in a tuberculous case was yellow it was almost certain that secondary infection was present An instance was cited showing the ease with which the smegma bacillus may be confused with Koch's organism and the importance of obtaining a catheter specimen in the female was emphasized Attention was drawn to the value of the intravenous pyelogram and the unreliability of the indigo-carmine test Mention was made of some particular diagnostic difficulties such as the occurrence of renal tuberculosis in early pregnancy and in old men

Nephrectomy, combined with a prolonged period of general treatment was advocated in unilateral disease while conservative treatment was reserved for patients in whom the disease was bilateral

General Discussion

MR SETON PRINGLE said that colic and slight albuminuria should be included as early symptoms and that frequency of micturition and turbidity of the urine were sometimes absent He hesitated to catheterize a kidney which he believed to be sound and he agreed that the indigo carmine test was often unreliable He had no doubt that tuberculin was of the greatest possible help if there was no active lesion of the lung DR G C DOCKERAY said he had never found tubercle bacilli in urine that did not contain both albumin and pus though the amount of pus might be quite small MR T A BOUCHIER HAYES mentioned cases in which turbidity of the urine and haematuria had been early signs of renal tuberculosis pain in the back should also be remembered in this connexion MR J C FLOOD asked why it was that tuberculosis was so often confined to one kidney What was the determining factor in establishing the focus in one kidney, and what was the percentage of people with tuberculosis in one kidney who subsequently developed it in the other?

MR A BUTLER DR CYRIL MURPHY, MR M FALLON and DR R M CORBET also took part in the discussion to which MR LANE replied

THE DEFENCE IN NEGLIGENCE CASES

At a meeting of the West London Medico Chirurgical Society on January 8, MR NEIL SINCLAIR presiding the subject for discussion was The Defence in Medical Negligence

MR ERIC PEARCE GOULD president of the Medical Defence Union said that it was unfortunately true that actions or threatened actions for medical negligence were on the increase This was attributable to a combination of causes One of these was a loosening of the old time relationship of mutual confidence between doctor and patient Another was that lay people were acquiring greater knowledge of medical matters A third was the news value of doctors peccadilloes such publication encouraged other people to attack their doctors The gravity of the position was enhanced by the disposition of juries to award very high damages and also by recent legislation which had extended the liability for the results of negligence from the doctor himself to his estate after his death

Actions for negligence fell roughly into four groups (1) The purely malicious the allegations being made by a disgruntled patient on no substantial grounds perhaps to avoid paying his doctor's bill (2) Cases in which there had quite frankly been negligence in these cases the course of action should be to obtain a settlement on the best possible terms for the doctor at the earliest moment (3) Cases in which there appeared to the layman to be prima facie evidence of negligence but in which from the medical point of view there was quite a good defence If the complainant was reasonable it might be wiser in these cases to make a settlement on suitable terms without allowing the matter to be pursued by legal process or negligence might be denied from the outset and a defence prepared and the action allowed to proceed Sometimes when a case had passed from the hands of one doctor to another between whom there was little co operation the second doctor had been accused of negligence and he had the perfectly good defence that he had taken on a case started by somebody else who had planned the line of treatment Often the defence society was convinced that there was a perfectly good defence but was met by the unwillingness of the respondent to go into court on the ground that the proceedings even if the verdict was favourable would attract undesirable publicity

supplies had failed materially to reduce its incidence Robert Koch had by this time demonstrated the great importance of carriers of the disease, especially those employed as cooks or otherwise connected with food supplies This association was verified in India, and as a result camps were organized in the hills to which all convalescent typhoid soldiers were sent and kept until proved by repeated bacteriological examinations to be completely free from infection A great reduction in the disease in the Army soon resulted, aided by agglutination tests to discover and eliminate all carriers among the native servants employed in cook-houses, etc

In 1900 Semple was selected for the difficult task of starting the first Pasteur Institute of India in the hill station of Kasauli, near Simla, and here he made an important advance through the use of carbolized emulsions of hydrophobia-infected rabbits nervous tissue, for this could be sent out for use in hospitals all over the country in graduated doses All-important time was thus saved by enabling the treatment to be carried out near the homes of the bitten people, in place of sending them many hundreds of miles to a central institute at great expense In 1905 a central research institute for the newly formed bacteriological department (now the Medical Research Department) of the Government of India was organized at Kasauli as a separate laboratory, and Semple held the directorship until he left India under the age rules in 1913, having retired with a pension from the Royal Army Medical Corps, as it was now called, in 1905 Here he did valuable administrative work and also much to help and encourage younger research workers in an unselfish manner Once more his services were requisitioned for the important post of Director-General of the Public Health Department in Egypt, where his bacteriological knowledge of cholera and other diseases was of value, and it was not until 1918 that he came home to a well-earned retirement While in India he was also a member of the Scientific Advisory Committee on Medical Research and of the Central Committee for the Study of Malaria in India, on the former of which his varied research experience was of value

Semple was of a very quiet and somewhat reserved nature, but a sound and reliable worker and a loyal colleague His full worth was probably only known to the few who gained his confidence and had the privilege of his friendship

[The photograph reproduced is by Elliott and Fry, Ltd.]

DAVID FRASER-HARRIS, M.D., D.Sc

Formerly Professor of Physiology Dalhousie University, Nova Scotia

The death took place in London on January 3 of Dr David Fraser Harris, who as a physiologist and neurologist and a writer on philosophy and on certain aspects of medicine had a reputation on both sides of the Atlantic

Fraser-Harris was born in 1867 and educated at Edinburgh Collegiate School Edinburgh and Glasgow Universities, and University College London He also devoted some time to foreign study and research at Berne, Jena, and Zurich He qualified in medicine in 1893, and four years later took his M.D. at Glasgow For five years he served as senior assistant to the professor of physiology and Muirhead demonstrator in physiology at Glasgow, and then went on to St Andrews where for ten years he was acting professor of physiology Leaving Scotland, he spent two or three years in the Midlands, as lecturer on physiology at Birmingham University and as lecturer on hygiene and school hygiene at the Birmingham and Midland Institute While at Birmingham he delivered a noteworthy series of lectures on the essentials of physiological history, and also served as a physiologist on a commission set up to investigate artificial respiration apparatus

In 1911 he accepted the appointment of professor of physiology at Dalhousie University, Halifax, Nova Scotia, and remained there for thirteen years He proved an acceptable personality in academic and scientific circles in Eastern Canada representing his university on the Medical Council of the Dominion, and occupying the chair of the Medical Society of Nova Scotia, the Halifax Medical Society, and the Nova Scotia Institute of Science He was also captain and adjutant of the Dalhousie University Contingent, C.O.T.C. In earlier years in Scotland he had commanded the 7th (University) Company of the 1st Fife R.G.A. St Andrews

Returning to England in 1924 at the age of 56, Fraser Harris had leisure to indulge his distinct gift for writing on scientific subjects in a popular way while yet doing no violence to the facts he had to present Book after book of this kind came from his pen, all marked by a deep understanding of his subject, and at the same time by imagination and by the clear and simple language in which he excelled His first considerable work was on *The Functional Inertia of Living Matter*, written while he was acting professor at St Andrews Fraser-Harris's pen led him into some curious and interesting byepaths, such, for example, as medical matters in the Apocrypha—the title of one treatise of his—the history of music in Edinburgh, and the references to biology in Shakespeare In this last little work, published in America, he drew attention to the penetrating observation shown by Shakespeare in the realm of living things He was also editor of the Modern Health Series

Professor Fraser-Harris joined the British Medical Association in 1895 and was honorary secretary of the Section of Anatomy and Physiology at the Birmingham meeting in 1911 He was Armistead Lecturer at Dundee in 1899, when his subject was wave forms of speech and music, and Thomson Lecturer in Natural Science at Aberdeen in 1911, when his subject was innervation He was a member of the Physiological Society, an original member of the Biochemical Society, and president of the Scottish Microscopical Society in 1908–9 After his return from Canada he interested himself in the People's League of Health and other activities A man of culture and quiet charm, finding his recreation, as he phrased it, in the study of biological history, he will be missed in many circles, and the British Museum reading-room will no longer have one of its most diligent occupants

J. EDWARD BOWSER, M.B., C.M.

We regret to record the death on December 27, 1936, of Dr J Edward Bowser, the oldest medical practitioner in Penrith Though his health had been failing for some time he was at work until within a few days of the end A native of Leeds, he studied medicine at the University of Edinburgh and graduated in 1886 In the course of his long medical career at Penrith he held many local appointments and took an active part in the town's affairs He had been medical officer for the L.M. and S. Railway Company in the Penrith district, and a member of the staff of the cottage-hospital During the war he had charge of the Wordsworth Street Hospital, and in more recent times was chairman of the Voluntary Aid Committee of the Cumberland and Westmorland Terri

Calcutta School of Tropical Medicine

The annual report of the Calcutta School of Tropical Medicine for 1935 was drawn up by Brevet Colonel R N Chopra I M S who succeeded the late Lieut Colonel H W Acton at the beginning of that year as director The present report makes special reference to epidemic dropsy and cerebro-spinal meningitis In the first of these it was shown that cardiac enlargement occurred in about 30 per cent of cases and that there was no myocardial degeneration though the heart did not obtain adequate rest The various stages of the evolution of sarcoids in this disease were defined and evidence was obtained indicating that the proliferation of the epithelial cells and the formation of new capillaries was probably caused by a toxin Epidemiological studies seemed to point to infection as the aetiological factor Doubt is cast upon the so-called mystery disease jhin-jhinia being a clinical entity In the department of pathology, bacteriology, and helminthology investigations have been continued on the cholera bacteriophage The gross mortalities in two series of cases in one of which bacteriophage was added to the usual routine treatment showed that definite benefit followed this addition The figures in those cases from which agglutinating vibrios were isolated provided even stronger indications the general impression being that complications such as uraemia might be averted and the general course of the infection be rendered milder The Mosquito Transmission Inquiry concluded that intensive transmission of malaria was not confined to the monsoon period of three or four months, but was possible all the year round under the conditions prevailing in Calcutta In the department of pharmacology it was shown that there was no direct relation between the concentration of quinine in the blood and the parasite count at any particular time and that the action of quinine on the parasite did not appear to be a direct one The Anaemia and Respiratory Diseases Inquiry showed that the vast majority of anaemias met with in the tea gardens were due to conditioned iron deficiency In all cases investigated there was heavy hookworm infection, the presence of these parasites did not affect regeneration of the blood when sufficient iron was given although the improvement was not maintained in cases in which the infection persisted Tetrachlorethylene proved to be a cheap and effective remedy for this infestation All the papers and memoirs which have been published in the *Indian Journal of Medical Research* and the *Indian Medical Gazette* are reproduced as appendices to this report

Medical Relief in the Punjab

Colonel C H Reinhold, Inspector General of Civil Hospitals in the Punjab in his annual report for 1935 maintains that the Punjab leads the rest of India in the distribution of dispensaries on an area and population basis, but adds that the need to day is a wider appreciation of the extent of tuberculosis, especially in the overcrowded towns Hill sanatoria only touch the problem and until the headquarters of each district has a sanatorium in its suburbs the problem will remain He believes that the tuberculosis unit of each district should be tripartite embodying a diagnostic dispensary in the town a hospital for advanced and observation cases on its outskirts and a sanatorium for curable cases within reasonable distance of the residences of relatives of the patients This is being effected in Amritsar and Rawalpindi owing to local official efforts and public generosity while in connexion with the Mayo Hospital Lahore a tuberculosis institute has been established No appreciable progress was made in the year under review in respect of medical aid for women by female practitioners and purdah women are consequently still suffering from great neglect Colonel Reinhold insists that it is necessary, therefore to proceed further with the Government scheme of 1926 which is largely in abeyance owing to financial stringency This scheme envisaged the establishment of a separate women's hospital at the headquarters of each district under the charge of a woman assistant surgeon There are at present fifty separate hospitals for women under the charge of medical women, five of which are maintained by the Government twenty three by mission authorities, and the remainder by various organizations The number of women medical students is increasing slowly, and additional facilities are having to be provided for them in some teaching centres The leprosy survey in the Punjab is proceeding but the Government considers it impracticable at present to apply to the Province the provisions of the Indian Lepers Act It has been decided however to push forward a scheme for establishing a settlement for burnt out cases to which lepers from the various homes could be transferred thus making room for the treatment of a greater number of active cases

ENGLAND AND WALES

The General Infirmary at Leeds

Since the General Infirmary at Leeds was opened for the reception of patients in the year 1869 a good many extensions have been carried out to meet its increasing requirements resulting from the growth in the number of patients treated and from the improved methods of dealing with these One of the first was the provision of a separate nurses home in the late seventies very soon found to be inadequate for the increasing staff and having to be enlarged in 1885 An additional nurses home was built in 1898 Among the greater extensions of the Infirmary will always be associated the names of Mr R Benson Jowitt and Mr Charles Lupton With that of the former one thinks of the provision of an extra ward pavilion a new out patient department the pathological block, and an isolation department With that of the latter one must always associate the King Edward memorial extension This provided another large ward pavilion, new operating theatres, a new out patient department, an extension of the accommodation for the nurses and some important structural alterations But things cannot stand still, and in large hospitals especially in those forming an essential part of a medical school, there can be no such thing as finality In 1933 therefore the foresight of Mr Lupton, and the enthusiasm of Mr A P Nicholson, the present chairman led to the launching of a great appeal for £250 000 Yorkshire has responded generously to this and on the last day of 1936 it was announced that the goal had been reached Some of the objects for which the appeal has been made are already well in hand and one of them, inasmuch as it has now been completed, may be briefly referred to here This consists in a further enlargement of the nurses home and has been most happily carried out The other objects for which the appeal was launched were a very complete and well equipped out patient department and a new ward pavilion for paying patients which has long been a crying want. The work on these two departments has already begun

St Mary Abbots Hospital, Kensington

The London County Council announces that the Bishop of Kensington will open a new operating theatre and x ray department at St Mary Abbots Hospital, Marloes Road Kensington The ceremony takes place to day Friday, January 15 at 3 p m The estimated cost of the new operating theatre and x ray department, including equipment and engineering services is approximately £13 500 The new buildings covering an area of 5 100 square yards are approached from the adjacent ward-block by means of an enclosed corridor St Mary Abbots Hospital and

Professor HENRY TONKS F R C S, who died on January 8 at his studio in Chelsea, was rightly looked upon as one of the most distinguished of living truants from medicine From Clifton College he went to the Royal Sussex County Hospital at Brighton as a pupil, and thence to the London Hospital He qualified in 1886, and became a Fellow of the Royal College of Surgeons of England in 1888 after holding house appointments and acting as temporary demonstrator of anatomy at "The London' Then followed a period of duty as senior resident medical officer at the Royal Free Hospital By that time, however, he had made up his mind to abandon medicine for painting, and after working under Fred Brown at the Westminster School of Art he went with him as assistant at the Slade School when Brown was appointed to succeed Legros as professor of fine art at University College, London, and he in turn succeeded Brown in 1918, holding the chair until 1930 As a teacher of painting Tonks had unique gifts and he wielded very great influence As a painter he was much admired, especially by brother painters, and last October a special exhibition of his works was given at the Tate Gallery, where seven pictures by him are permanently housed During the war Tonks served with the Red Cross in France and elsewhere, and as one of the officially recognized artists at the front he made many paintings, his most important picture of that period being 'An Underground Clearing Station, Arras," now in the Imperial War Museum collection On his return to England he did valuable service at the Queen's Hospital for Facial Injuries, Sidcup, and more than seventy pastel drawings by him of men treated there for wounds received during the war will be found in the Army Medical Collection at the Museum of the Royal College of Surgeons of England

Dr W MCKIM MARRIOTT, whose death from appendicitis occurred on November 11, 1936, was only 51 years of age He had held the position of professor of paediatrics for twenty years in the School of Medicine at Washington University, St Louis, U S A, where for a considerable number of years he had also acted as dean of this school On July 1, 1936, he took up his new appointment of dean and director of research at the University of California School of Medicine His contributions to paediatrics, especially in the field of infant nutrition, will ensure him a lasting reputation

Dr JAMES MCCONECHY who practised at Bramwell, Leeds, for nearly half a century, has died at the age of 72 He was born in Scotland, and graduated M B, C M of the University of Glasgow in 1886 After acting for a time as medical officer to the P & O Steam Navigation Company he settled in general practice at Bramwell, and continued in harness until a few weeks ago He joined the British Medical Association in 1918

Medico-Legal

MISLEADING MEDICAL TITLES

A SUCCESSFUL PROSECUTION

At Lambeth police court on January 6 before Mr McKenna William Mellor of East Dulwich Road, East Dulwich was summoned at the instance of the Medical Defence Union for contraventions of the Medical Act, 1858 Mr G D Roberts counsel instructed by Messrs Hempsons, solicitors appeared on behalf of the Union, and the defendant who pleaded Not Guilty, was represented by Mr W H Chitty solicitor

Mr Roberts stated that the defendant was brought up on three summonses under the Medical Act The first was for wilfully and falsely using the description Medical Examiner thereby implying that he was registered under the Act the second was for similarly using the title Doctor of Medicine, contrary to Section 40 and the third was for using the description "Doctor" with a like implication The first two of these charges arose out of a form completed by Mr Mellor for a Miss Pitman, who had applied to the Air Ministry for a private pilot licence The requirement that such form should be in proper order was obviously very important from the Air Ministry's point of view, and a careful check was made of all signatures to such applications At the top of the form was a notice that it must be completed by a registered medical practitioner holding British qualifications At the foot Mr Mellor had signed himself "William Mellor, Medical Examiner," and had added "M A, M D, B Sc, Lic Hom Med (India)" The third summons was in respect of the nameplate outside his surgery, which bore the title "Dr Wm Mellor," and in brackets after his name "Indian Osteopath and Homeopath, U S A" Mr Mellor's name was not on the British *Medical Register* He claimed to hold a diploma of the Western University, Kapurthala but the college was not recognized as issuing diplomas registrable in this country

The defendant, in evidence produced a number of certificates and diplomas, and declared that he held four degrees as a result of examinations in the London and Liverpool extensions of an Indian and of some American universities or colleges He had been granted the degree of "Doctor of Osteopathy" of New Jersey College, U S A, and "Doctor of Medicine and Master Diagnostician" of the American Academy of Medicine and Surgery He had never held himself out to be on the British *Medical Register*, nor attempted to practise as such It was submitted on his behalf that there was here no case of wilfully and falsely using a title or description

On the first summons, that of wrongly using the title "Medical Examiner," Mr Mellor was fined ten pounds with twenty guineas costs On the second summons which related to the same occasion, no fine was imposed, and the third, based on the nameplate, was dismissed

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

Dr John Alfred Ryle, Regius Professor of Physic, has been elected to a professorial fellowship at Gonville and Caius College

UNIVERSITY OF LONDON

The following candidates have been approved at the examinations indicated

M D—*Branch I (Medicine)* J A Brocklebank A M R Cann E A Danino, C J Gavey, N M Green, R R Henderson, A L P Jeffery, M S, E Jones E I Jones, F A Jones A L Light M S, G A M Lintott Mary F Lockett B McArdl, D C Rennell A M Stewart-Wallace, J B L Tomblson *Branch II (Pathology)* G J Cunningham, A H T Robb Smith (University Medal) *Branch III (Psychological Medicine)* A C Dalzell (University Medal) *Branch IV (Midwifery and Diseases of Women)* Agnes V Kelynack, L W Lauste, G G Macdonald, Marjorie E Roberts, J W Schabort, Violet H Whapham *Branch V (Hygiene)* K Biden-Steele

M S—*Branch I (Surgery)* J Hawkins, J B G Muir (University medal) E J Smith

Lectures at University College

Professor J C Drummond will deliver a course of six public lectures on "Problems of Nutrition" at University College Gower Street, W C, on Tuesdays, at 5 p m, from January 19 to February 23, and a course of six public lectures on "Chemical Structure and Pharmacological Action" will be given by Dr H R Ing on Mondays at 5 p m from January 25 to March 1 Admission to all the lectures without fee or ticket

Recognition of Teachers

The following have been recognized as teachers of the University in the subjects indicated in parentheses

King's College Dr H A Dunlop (Pharmacology)

St Bartholomew's Hospital Medical College Mr J P Hobbs (Surgery), Dr James Maxwell and Dr A W Spence (Medicine)

The blood in Dr Findlay's cases was taken from the ear but he does not mention details of technique Dr Paul Drucker whom he quotes has demonstrated that in infants the readings obtained from ear blood as ordinarily taken are remarkably erratic and that to obtain readings from the ear that are not vitiated by capillary changes it is necessary to make a cut preferably a deep one with an extremely sharp instrument such as a cataract knife (not an ordinary scalpel) On the other hand readings obtained from blood taken from the heel of the infant with the usually accepted precautions are much more constant Furthermore values obtained from ear blood with a scalpel cut are higher than those from the heel in babies under 1 year old in Drucker's series the difference varied from − 3 to − 38 per cent He gives an example A baby of 3½ months showed ear readings varying from 113 to 89 per cent the corresponding heel readings were 78 and 79 per cent In babies under 6 months old the ear readings averaged 13 5 per cent higher but by 2 to 6 years old the difference had diminished to an average of 3 5 per cent Using a cutting needle for pricking ear and heel respectively my results on a very much smaller series of cases corresponded with Drucker's in giving high and erratic readings for ear blood Hence unless Dr Findlay used a cataract knife making a deep cut in the ear it is probable that individual readings of his infants should be reduced by anything up to 38 per cent, which would give a very different complexion to his figures

In the light of recent work has not Dr Findlay accepted too low a curve for his lower level of normal ? In any case I think I can claim to have proved that babies of 6 to 12 months old whose average haemoglobin level was on the whole slightly *above* Dr Findlay's 'lower limit of normal' but whom I should call slightly anaemic, had a markedly increased morbidity rate as compared with those whose haemoglobin was kept at a higher level by giving extra iron I have at the present time a series of babies under observation whose average haemoglobin has been kept consistently at 82 to 85 per cent from 5 to 18 months old by this means

The Queen's Hospital for Children like the Princess Elizabeth Hospital, is in the East End of London, and happily there is no doubt that among our patients severe nutritional anaemia in infants is much less frequent than ten years ago This I believe, is due to the recognition of the need of widespread prophylactic treatment with iron That anaemia of a lesser grade is common is, I think, indicated by Dr Findlay's own figures It would be a calamity for the babies if Dr Findlay, with his wide influence in the paediatric world persuaded us to cease our efforts to stamp out nutritional anaemia among them —I am, etc,

Pathogenesis of Cancer

SIR —About three years ago you were good enough to publish a letter from me giving expression to my view of the cause of cancer I did not expect to trouble you again but *after many years of failure in my endeavours* to obtain any consideration for it by those engaged in cancer research I have been encouraged by some recent letters in the *British Medical Journal* to think that others are trending the same way The view was that cancer commenced in the tissue intended for the repair and maintenance of the organs and other anatomical structures of the body, and that it always showed strong indication in structure of the tissue in which it arose When it was possible to obtain the growth in its very earliest stage it could hardly be called malignant, and was curable by complete removal For a long time I blamed overnutrition for encouraging overgrowth in tissues intended only for normal needs but of late years, with the help of fresh knowledge I have felt more and more impressed by the possible influence of sex hormones One needed to find some process which would cause the—perhaps unstable—repair cells to take on the embryonic type of cancer cells I *used to regard* over nutrition and oversexed conditions as the cause of cancer and now the association seems to become more and more clear

Cancer is probably, almost certainly very rare or quite unknown in the *really* wild life of any class of animal but it is common and almost yearly becoming more common in man and all domesticated animals encouraged to lead a life more or less based on human habits This leads one in looking for the cause to believe that we should study the influence of habits If we could see back to the earliest stage of the wild life of man when he had to search and fight for enough food to live on, or often go without, when his sex functions only came into use when they were definitely required for procreation was there any cancer? I think not But as man's intelligence gave him gradual control over the animal world so he became more capable of luxury and more inclined to induce his womenfolk to disregard nature's habits Thus gradually he has brought about in the course of countless centuries a greater and greater domination of the sex glands

On such lines we have to search for the cause of cancer an evolutionary cause—not a germ a castigation for mankind to stamp out his errors or himself Natural life in this world has to fight for its existence Things should not be too easy for us if we are to be strong and healthy The struggle for existence must go on we must labour and fight Signor Mussolini and Herr Hitler are the wise men of modern days They have recognized the change that was needed and stand perhaps unconsciously as leaders in the search for the much longed for cancer cure They have each planned for their entire populations the widest possible health experiment Good luck to it! I hope they will let us know while the fat countries are becoming more cancerous if they are growing less so The banishment of luxury the recognition of the value of honourable labour and of the generous spirit to fight for home and country must deserve and reap its reward

I am now in my eighty sixth year and still hope that some may accept the reasonableness of my belief and tear themselves from their experiments on cancerous mice to test the possibilities of controlling the influence of sex glands My faith rests mainly on the regeneration of the human race—a very slow process But in the meantime they might discover a method of treatment which would give a better result than any we can at present obtain —I am etc,

Grayshot Surrey Dec 28 1936 FRANK T PAUL

Substances Promoting Cell Growth

SIR —Dr Needham's article in the *Journal* of October 10, 1936 (p 701) is interesting and his ideas on the origin of cancer are intriguing but perhaps a little criticism from one completely outside the realm of cancer research might not be amiss Dr W Cramer's letter (*Journal* November 14 1936, p 997) emboldens me now to state what I have thought for many years

On account of its histological appearance some pathologist in the long ago, spoke of malignant tissue as embryonic Ever since, many of those who think about

QUERIES AND ANSWERS

Treatment of Lumbago

'S L A writes Have any readers experience of solurol and urodonal in the treatment of lumbago? Has the urine to be acid or alkaline to get best effects? Is there any risk (as with atophan and its allied drugs) in prolonged use? What dose is recommended for an adult, and how often daily?

Income Tax

Allowance to Relative

"JUSTICE" makes an allowance of £14 a month to a relative who has no other income, and asks whether it would be legal to allot this money by deed and so avoid paying income tax thereon

*** It would be quite legal, but would be ineffective for income tax purposes unless the disposition of the income was for a minimum period of seven years, or for the joint lives of "Justice" and the relative, whichever period be the less (It is assumed that the relative is not a son or daughter of our correspondent) Once the payment has become legally compulsory 'Justice' can deduct tax at standard rate when making the payments, and the relative can then reclaim from the Inland Revenue Department nearly the whole of the tax so deducted As matters stand 'Justice' is entitled only to the dependant relative allowance subject to the condition that the dependence is due to old age or infirmity

Private Use of Cars

'S S asks whether it is usual to charge income tax on private use of cars when the private use is very slight

*** We believe the answer to be in the affirmative Most inspectors of taxes make a point of inquiring about private use where the cost of maintenance etc, is claimed as wholly and exclusively incurred in earning profits To the extent that the expenses do not fall within that category they are not allowable and though there may be some cases in which private use is so small as to be ignored, it is certainly very common for, say, 5 per cent, or even more to be excluded from the total cost when calculating taxable profit

LETTERS, NOTES, ETC.

Prophylactic Against Influenza

Dr ALEXANDER FRANCIS (London W 1) writes At a time like this when influenza is so rife it is sad that Dr Carl Spencker's advice is not properly appreciated He stated that if anyone would take three drops of the English tincture of iodine in two tablespoonfuls of milk after breakfast daily for three weeks he would remain immune from influenza for months I have tested this remedy for many years in private practice and in schools with astounding results It has the great disadvantage of being too simple It is not impressive, as are vaccines, gargles, douches, etc, but on the other hand it has the advantage of being effective The iodine must be taken in milk, because in the form of iodide of casein it is not in any way irritating Some few people who are subject to iodism cannot take iodine in any form

Psychotherapy of Delinquency

With reference to the weekly seminars for probation officers and social workers arranged by the Institute for the Scientific Treatment of Delinquency, announced in the *Journal* of October 31, 1936 (p 901), we are informed that Dr Denis Carroll will speak on 'Psychiatry and Psychotherapy of Delinquency" at the West End Hospital for Nervous Diseases, Welbeck Street, W, on Thursdays, January 21 and 28, at 6 45 p m Admission 1s 6d

C S M M G Directory

The Chartered Society of Massage and Medical Gymnastics has issued a *Directory of Members*, which is supplied free on demand to medical practitioners, who by this means can easily find the names of masseurs and masseuses practising locally Since the members of the C S M M G are precluded from undertaking any case except under the direction of a registered medical practitioner, from advertising in other than recognized medical and nursing papers, from selling goods to patients in a professional capacity and from accepting secret commissions on the sale of goods, they have a special claim on medical practitioners whose patients are in need of physical therapy in its various forms Special designations are attached to those who hold additional qualifications in medical electricity, light and electro therapy, and hydrotherapy, as well as to those who are teachers in such subjects Members with additional qualifications such as associates of the Royal Sanitary Institute, members of the Society of Radiographers, and registered mental or fever nurses are correspondingly distinguished The *Directory* is compiled alphabetically in geographical sections, including England, London Scotland, Wales, Ireland, and in foreign countries, an alphabetical list of practising members is also given after the geographical section Applications should be sent to the secretary, C S M M G, Tavistock House (North), Tavistock Square, London W C 1

A Medical Veteran

Dr Cuthbert Robert Kendal of Hexham, Northumberland celebrated his ninety-fifth birthday on January 1st He began practice in Wark in 1863 immediately after qualifying and went to Hexham in 1870

Merck Products

Messrs E Merck Darmstadt, manufacturers of chemicals and medicinal specialties announce that since January 1 1937 the selling rights for their preparations in the United Kingdom and Irish Free State have been in the hands of Messrs Savory and Moore, Ltd, of 61 Welbeck Street London W 1 The publicity department of E Merck which was established in this country for the convenience of medical practitioners wishing information and samples of the Merck products, has moved to 60, Welbeck Street

Treatment of Streptococcal Infections

It may interest readers to know that para-aminobenzene sulphonamide, referred to in the leading article entitled "Therapia Sterilisans Magna" in the *Journal* of January 9 (p 79) is obtainable from a number of firms in this country

Correction

Our report of Dr H W Eddison's paper on "Anxiety" (January 9, p 92) went astray in the second column, line 14 The passage should read 'In the war many, in spite of their anxiety, stuck to their posts and masked their anxiety behind their deeds, working off their emotion coincidently *On the other hand the men who were stolidly unconcerned (to all appearances)* afterwards displayed tremors (correction printed in italics)

while the real cause lies in the pyriform fossa? Surely earache can be regarded as an early sign

Since the article is concerned with early diagnosis, I am wondering what made Mr Pilcher decide to leave out the precancerous phase of this disease As an example, I mean the sensation of a lump in the throat associated with the picture of dysphagia and anaemia especially in women between the ages of 30 and 50 (the Paterson–Brown Kelly syndrome) It is not often that one finds an organic basis for the lump in the throat in the stout neurotic woman but the pale thin anaemic woman complaining of a lump in the throat demands very close attention To my mind there is a close relationship between this sensation and normal salivary flow The apprehensive sensitive woman can easily upset her autonomic nervous balance and with a resulting sympathetic control saliva is diminished and the cricopharyngeus is tightened This in the thin anaemic woman over a period of years can cause a post cricoid lesion I often wonder whether her edentulous stout non anaemic sister is as liable to the same danger I cannot give actual figures but my impression is that she is not—I am, etc,

Cardiff Jan 5th ROBERT D OWEN

Allergy and Agranulocytosis

SIR,—In his interesting article on agranulocytosis and amidopyrine (*Journal* November 7 1936, p 911) Dr S C Dyke states Plum performed an intradermal test with a small dose of amidopyrine on a subject known to develop agranulocytosis after ingestion of the drug but obtained no skin reaction This appears to offer conclusive evidence against the allergic theory This statement shows some lack of familiarity with the essential known facts relating to allergy I think that all workers who have extensive opportunities of observing allergic patients will agree that as a rule gross idiosyncrasy to a drug may exist without any skin reactivity to that drug Hypersensitiveness to aspirin is surely a fairly typical allergic phenomenon and yet most authorities consider it most unusual to find any skin reactivity to it Personally I have never seen a skin reaction to it It is generally assumed that the aspirin after ingestion combines with some naturally occurring substance in the body fluids to form a compound which gives rise to the typical allergic phenomena Some of Landsteiner's work seems to support this theory The word allergy has often been misused but it still conveys a fairly definite and uniform meaning for those especially interested in that work It would seem to be a serious mistake to regard a phenomenon as not allergic simply because no skin reactivity could be demonstrated in connexion with it—I am etc,

CHARLES SUTHERLAND M B M R C P

Melbourne, Dec 22 1936

Urinary Proteose in Asthma

SIR—In the paper by Drs Libman and Bigland (*Journal* January 9 p 62) it is stated that the erythema on the skin produced by the proteose of Oriel and Barber is non specific and is due to a toxic action Also van Leeuwen (1932) found that the proteose did not necessarily produce reactions in asthmatics from whom it was prepared Oriel states that it contains the antigen and that there is a very violent poison present which also acts as an antigen At first only 0·5 c cm of a dilution of 1 in 1 000 000 can be administered It is not known what this toxin is, but it is possible that it may be derived from the anaphylatoxin which is separated in the urine It would seem to be an advantage if this substance could be separated from the proteose Oriel thinks the blood has difficulty in dealing with the proteose and that the administration of peptone assists the blood to digest it

I have no practical knowledge of this proteose, but I think the figures given by the writers show that they have been using the lowest doses of the Armour peptone I have found in the last two or three years that Witte's new peptone 30 is best and it may be given in doses rather larger than the Armour peptone though the variation in patients is very great As Dr Hutchison (p 57) says in the previous article Every individual is really a new amalgam or experiment

Those who write on the peptone treatment of asthma all say that its action is unknown May I venture to remark that there seems to be a clear cut action? It was found by Abderhalden that when a heterogeneous proteose or peptone is parenterally introduced both the rotation in the polariscope tube and dialysation show the production of proteolytic and peptolytic defensive ferments which produce their assimilation The allergen reagin product in asthma is doubtless a peptone and it would succumb to this ferment—I am, etc

London W 1 Jan 9 A G AULD

A Pitfall in the Diagnosis of Bence-Jones Proteinuria

SIR—*Last year I was asked to see a middle aged man* who was thought to have Bence Jones protein occasionally in his urine By ordinary examination of the patient he seemed somewhat overworked and anxious but otherwise well The supposed abnormality in the urine had been recently detected in the course of a routine periodical medical examination In a urine of specific gravity 1020 *faintly acid* to litmus paper there was no precipitate on heating slowly to the boiling point, except an ordinary phosphatic turbidity which cleared up on the addition of dilute acetic acid, but on cooling the test tube under the cold water tap a precipitate occurred which disappeared on reheating and so on In this case it was easily proved by the various recognized tests that the precipitate was of urates and not of Bence Jones protein

If the Bence Jones proteinuria had been genuine it would have been practically equivalent to a death sentence and the patient had apparently got some idea into his head of the gravity of the condition The reaction in question would be observed frequently if doctors looked at the test tubes containing boiled and acidified urine an hour after the boiling I have had to go back a long time to find a published case in which such a mistake may have arisen In 1901 in the *British Medical Journal* (1901 2, 713) there was a note by Dr J A Blair on a Case of Albumosuria referring to Dr T R Bradshaw's account of what we should now term Bence Jones proteinuria Dr Blair's patient was a man aged 64 years whose urine he examined during a severe illness Regarding the supposed albumose he wrote

It had the characteristic reactions of being precipitated in the cold by nitric acid of dissolving in the heat and of reprecipitating on cooling The urine was acid in reaction dark in colour and gave no perceptible precipitate on simple heating without acid

urethral resection is, in his opinion, a urethral stricture which prevents the passage of instruments In none of his fifty cases was there such a stricture The operation he prefers is that associated with the names of Brasch and Bumpus, and only in rare cases does he restrict his activities to pure electrocoagulation It should, in fact, be as limited as possible, the giant's share of the operation being reserved for the excision of prostatic tissue in morsels of which the author has removed as many as forty-five and as few as four at a time In practically every case sacral anaesthesia lasting about an hour and a half was induced Only five of the patients were under the age of 60 A list of questions addressed to ex-patients was filled in by many, and twenty-four answered "Yes" to the question "Are you satisfied with the result of the operation?"

42 Total Thyroidectomy in Cardiovascular Lesions

F MANDL (*Wien klin Wschr*, November 27, 1936, p 1453) has carried out total thyroidectomy in the following six groups of seventeen patients (1) Hyperthyroidism where the cardiac symptoms predominated in the clinical picture (2) Severe cardiac affections uninfluenced by the usual methods of treatment (3) Angina pectoris in the presence of high blood pressure (4) Endarteritis obliterans (5) Dyspnœa in the presence of severe emphysema (6) Cardiac asthma In all these cases total thyroidectomy was carried out under local anaesthesia (without adrenaline) without a single death Only one patient died three months after the operation from coronary thrombosis One patient developed slight transitory tetany four days after the operation The same applies to myxœdema, not one of the operated cases developed marked myxœdema The therapeutic effect of the operation was most remarkable There was a disappearance of cyanosis pulmonary stasis, cough, and anxiety within a few weeks following the operation The only contraindication to total thyroidectomy is a basal metabolic rate of minus 20 or 30

Therapeutics

43 Salt-free Diet in Neuro-dermatitis

P MULZER and H SORENSEN-PETERSEN (*Dtsch med Wschr* November 20 1936, p 1918) report from the University Dermatological Hospital in Hamburg their experiences with the dietetic treatment of neuro-dermatitis, which, in their opinion is often, but not always, an allergic reaction When it is so, and specific sensitization is demonstrable the allergic condition is as a rule polyvalent Investigations have shown that the daily addition of 15 to 20 grammes of sodium chloride to the food provoked an exacerbation of neuro-dermatitis usually on the first day, but in some cases on the second to the fifth day The exacerbations consisted as a rule of violent itching, so severe in some cases that it became unbearable, and the administration of the salt had to be discontinued At the beginning of a sodium-chloride-free diet the authors have found it desirable, particularly when the symptoms were acute and the itching severe, to add salts of calcium, magnesium and potassium to the food to replace the sodium chloride It was also found desirable to supplement this dietetic treatment with the local application of lanolin and vaseline to relieve the troublesome dryness of the skin Some tar preparation also occasionally proved beneficial locally As a rule the effect of the restricted diet upon the general condition of the skin was not demonstrable till the treatment had lasted from four to six weeks and in the few cases in which the disease was refractory the neuro-dermatitis was invariably of a severe and universal character and was associated with neurasthenic manifestations Even in the cases responding favourably a return of the disease followed, sooner or later, the discontinuation of the salt-free diet Such relapses could, however, be more or less avoided by dietetic discrimination aiming at the elimination of the salt foods found by experience in each case to be most injurious The authors' table showing the results of this treatment deals with fifty-one patients who were "practically cured," sixteen who were much improved, one who was slightly improved, and one who was refractory

44 Cholesterol in Fractures

A GRASSI (*Policlinico*, Sez Chir, November 15, 1936, p 544) carried out experiments on fifteen rabbits to determine whether the injection of cholesterol would accelerate the process of cure in fractures The experiments were performed by intramuscular injection of 1/2 c cm daily for three to four days of a 2 per cent oily solution of cholesterol in the neighbourhood of the fracture The animals were killed in groups of three at a time, one after treatment by cholesterol, one after treatment by normal saline solution, and one without any treatment, four, ten, fifteen, twenty, and thirty days after subcutaneous fracture of the radius The results were as follows The favourable effect of cholesterol on the fixation of calcium in the normal sites for its deposit was demonstrated both by radiological and histological examination The radiological picture showed a larger quantity and greater opacity of the callus in animals treated by cholesterol compared with those injected with normal saline solution or those which had no treatment at all The histological picture confirmed the radiological appearance by showing the characteristic features of an accelerated process of consolidation compared with the controls—namely, activity of proliferation in general, early disappearance of cartilaginous tissue, and rapidity of transformation into osteoid tissue and true bone as compared with controls There was also a more rapid absorption of the internal callus with a reconstitution of the medullary canal and reconstruction of the diaphysis All these phenomena of the acceleration of the process of calcification of the callus and consolidation of the fractures in animals treated with cholesterol as compared with the controls were more marked at an early stage (from the tenth to the twentieth day) than later

45 Opium Addiction

M GERARD KELLY (*Irish J med Sci*, October, 1936, p 627) discusses the value of the Modinos blister serum method in the treatment of opium addiction Altogether 353 cases of addiction, undergoing sentences in the Burmese gaols, were treated by this method Discussing the incidence of opium addiction it is estimated that 7 per cent of the non-European population of Burma consume opium in one form or another, this addiction being twenty times more frequent among Chinese residents For the purpose of the inquiry the addicts were classified as (1) smokers, (2) eaters, (3) smokers and eaters, (4) eaters and injectors, (5) smokers, eaters, and injectors The method used was to place an 8 sq cm by 1 mm thick emplastrum cantharidis on the abdomen, and seven hours later the blister fluid was drawn off and injected this being done up to six times at three day intervals Of the smokers 82 per cent reacted favourably, eaters 72 per cent, smokers and eaters 74 per cent Those classed in the other two groups, exhibiting advanced mental, physical, and moral degeneration showed little improvement The reaction produced in patients is that of temporary distaste for opium Although the method is based upon discarded theory, it was found in actual practice to be a valuable method of denarcotization, its advantages being cheapness and safety, its disadvantage being its failure occasionally to mitigate withdrawal symptoms, and its slight influence on the relapse rate

scopic examination Urethroscopy alone will show the true condition In some cases it may be a pronounced prostatic bar in others a unilateral lobe enlargement producing a pressure concavity on the other side By cystoscopy alone a prostatic bar cannot be adequately diagnosed only urethroscopy will reveal its true size

I agree with Mr Ross on the types of cases that he states definitely call for endoscopic resection but I disagree with him entirely in the types he maintains are not suitable I have operated on many cases where the inverted V angle was less than 40 degrees and in many where there was practically no angle but the lateral lobes approximated In these cases if the middle lobe protuberance is ablated and if the lateral lobes are sufficiently undercut and resected then a cure is always obtained I am using the word cure in a symptomatic sense but I have had no case yet (six years) which has required a repeat operation and all my cases are under constant supervision I dislike Mr Ross's advocation of prolonged indwelling catheter drainage of the bladder if over a week I prefer suprapubic drainage by means of a de Pezzer catheter I notice he mentions that suprapubic drainage as a preliminary is useful in some cases suitable for resection for afterwards continuous irrigation with sodium citrate may be carried out Continuous irrigation is not dependent on this preliminary procedure for in all cases of resection continuous irrigation with sodium citrate is an advantage This may be carried out by passing a twin-channel catheter which has been made for me by the Genito Urinary Manufacturing Co, or by passing two catheters—Nos 8 and 10 F These cause no discomfort to the patient and are usually removed in two or three days Unless haemostasis has been adequate before the catheters are passed it will be necessary to half fill the bladder with the citrate solution before the patient leaves the operating table otherwise clots may form in the bladder before efficient ward routine is instituted

Apart from cases of *diverticula and calculi* there are only two types of prostatic obstruction which cannot be treated by resection The first is where a cystoscope cannot be passed into the bladder because of the enormous enlargement of the prostate I have had one such case The second is where the prostate is so uniformly enlarged that no vesico urethral obstruction is apparent Generally at least 96 per cent of prostatic patients can be successfully treated by endoscopic resection The only objection to this routine treatment is the fact that a proportion (20 per cent) of apparently normal prostates show on routine serial microscopy to be malignant and although the pieces removed by resection may be reported by the pathologist to be benign occasionally malignant manifestations appear later This however is of no practical importance, for a malignant prostate once diagnosed is not amenable to curative treatment Suprapubic drainage prolongs life for as long as any radical operation or radiological treatment A malignant prostate kills slowly but surely—I am, etc,

London W 1 Jan 3 F McG LOUGHNANE

Recurrent Extragenital Haemorrhages

SIR,—May I trespass again upon your space to add a few words to what I wrote in the *Journal* of January 9 (p 69) By a coincidence the girl whose history formed the basis of my remarks in that paper returned temporarily to Kendal and came to see me last week thus giving me an unexpected chance of discovering any further developments, but too late to add to my previous account of her case Briefly, what she had to tell me was this

She has had fits since she left the Royal Southern Hospital Liverpool in July 1936

All the extragenital sources of haemorrhage have dried up with the exception of the eyes from which she has had light occasional bleeding at times unassociated with menstruation and in addition at each period On one occasion such haemorrhage was apparently substitutional for the period (November)

Menstruation has been regular since August but for one lapse at the end of November 1936 The periods have recurred with that exception every four weeks and lasted four days In early September her period was a few days late It lasted four days and was accompanied by slight haemorrhage from the eyes In early October the period lasted three to four days and there was no additional bleeding In early November the period lasted four days and there was slight haemorrhage from both eyes At the end of November there was no period but slight bleeding from both eyes off and on for three days At the end of December the period began on the 29th and lasted four days She bled from the eyes slightly on the morning of the second day the same evening and the following morning

It must be admitted that very considerable improvement has been made I believe that the girl has taken to heart the encouragement and advice tendered to her—namely, that she is in no sense abnormally made that she is not an epileptic that if she can convince herself that these haemorrhages have been aggravated even if not entirely caused by her unconscious dwelling upon the less pleasant details of menstruation they will cease and that she will in time be completely cured—I am etc

Kendal Jan 9 WILLIAM H GOSSIP

The Consistency of University Examinations

SIR—In his interesting comments on Dr W Gilbert Millar's paper (*Journal* December 12 1936 p 1209) Mr John L Hardie in your issue of January 2 (p 44) enters a few useful caveats against the too ready acceptance of the somewhat sweeping generalizations made in summary *form at the conclusion of the article* Dr Millar's interesting paper was essentially an attempt to assess statistically the value of what is known as the combined examination in the third year of medical study in Edinburgh introduced seven years ago In spite of expressed doubts about the validity of some of Dr Millar's general conclusions Mr Hardie writes that the prognostic value of the combined examination in the third year seems fairly well established and expressed himself in favour of this type of investigation being extended to other medical schools and the results compared I venture to express the hope that no such extension in relation to the third year's curriculum of medical study will ever take place and stated very briefly for the following reasons

In his paper Dr Millar reported how in 1928–9 an important modification in the third year's teaching was introduced whereby the systematic teaching in pathology bacteriology pharmacology therapeutics medicine and surgery was co ordinated so that the student is so far as possible taught all aspects of a particular disease at the same time In the first six months of this year the student also gets his first and main introduction into practical medicine by attendance at clinics and personal study in the medical wards etc If the student fails to get a diploma in the combined examination in the six or twelve months he may lose six or twelve months and be otherwise prejudiced It is only natural that after two or three months in the wards the examinations ahead begin to loom largely I do not for a moment suggest or admit that the teaching of these six subjects either before or

51 Limitations of the Aschheim-Zondek Reaction

K EHRHARDT and H KRAMANN (*Zbl Gynak*, November 7, 1936, p 2642) maintain that in spite of all recent advances in hormonic diagnosis it is still impossible with certainty to diagnose between a corpus luteum cyst and tubal pregnancy In illustration they quote the following cases (1) A woman aged 30, after a missed menstruation, had acute abdominal pain, a livid cervix, a soft slightly enlarged uterus, a cystic adnexal swelling, and a positive Grade III Aschheim-Zondek reaction Laparotomy, however, showed a corpus luteum cyst (2) A nurse aged 20 had a non-inflammatory adnexal resistance with positive Aschheim-Zondek reaction she denied the possibility of pregnancy, and the external findings pointed strongly to virginity With expectant treatment the test became negative (Grade II positive for two, Grade I for six days) and the symptoms disappeared A diagnosis of persisting corpus luteum was made with confidence The writers point out that amenorrhoea associated with persistence of the corpus luteum is now well known, and is due to the lack of endometrial destruction which is hormonically induced, in physiological conditions by regression of the corpus luteum The chance of confusion between lutein cysts and tubal pregnancy is increased when, as in some recorded cases of the former, well-developed decidual tissue is recovered from the uterus, or when a cyst bursts and bleeds in addition, the persisting yellow body may cause painful uterine contractions and morning sickness Cases in which the hormonal test has been done before operation, in corpus luteum cysts are very few, but Kaiser (*Zbl Gynak*, 1933, **5**) has recorded a previous case Two practical conclusions have emerged regarding the value of the Aschheim-Zondek test (1) in ectopic pregnancy only a positive reaction is of real value, negative tests being obtained after chorionic detachment (2) Even with a positive test, as the above cases show, a mental reservation must be made with regard to the (rare) possibility of a persisting corpus luteum function There is some evidence that this in its turn is due to anterior pituitary dysfunction

Pathology

52 Rabbit Papilloma Virus

P ROUS J G KIDD, and J W BEARD (*J exp Med*, September 1936, p 385) describe their observations on the effect of inoculating domestic rabbits with the cottontail rabbit papilloma virus of Shope In its natural host—the cottontail rabbit—this virus causes an endemic disease, characterized by the development of skin papillomata Only a certain proportion of the animals are susceptible to inoculation with the virus, and in more than half of those animals in which papillomata do develop retrogression of the growths occurs sooner or later Malignant change rarely occurs The domestic rabbit, on the other hand is highly susceptible Not only do papillomata develop readily but a considerable proportion of them undergo carcinogenic transformation It is found that the more rapidly the papilloma develops the sooner and more often is cancer likely to occur In rabbits inoculated with a concentrated suspension of the virus papillomata develop within seven to fourteen days, seldom retrogress and frequently give rise to cancer in four to eight months In those animals inoculated with a dilute suspension papillomata take eleven to twenty-five days to develop, often retrogress and give rise to cancer more seldom, and then not as a rule for eight to fourteen months That the difference between the reaction of the cottontail and the domestic rabbit is not due to any constitutional factor tending to prevent malignancy in general seems to be shown by the fact that the cottontail rabbit appears to be more susceptible than the domestic rabbit to the induction of tar cancer In another paper P ROUS, J W BEARD, and J G KIDD (ibid, p 401) describe the histological behaviour of the papillomata and the carcinomata derived from them, and discuss the aetiological role of the virus in their development

53 Testes and Somatic Carcinoma

E E COLLINS (*Arch Pathol*, October, 1936, p 470) reports a critical quantitative comparison of the numbers of interstitial cells in the testes in 173 carcinoma cases and 173 carcinoma-free patients—ages range from 20 to 90 years—and in mice, seventy-two with transplanted mammary adenocarcinoma and sixty normal In all the 346 men there was a wide range of variation of the interstitial cell content of the testes, and except for two carcinoma cases there was no significant difference between testes from carcinoma and non-carcinoma cases In the mice there were neither gross nor microscopical differences between testes from tumour-bearing mice and those from normals, in no case was there any tubular atrophy or fibrosis In the human testes, on the other hand, hyperplasia of the interstitial cells was always associated with atrophy and fibrosis of the tubules, and had the same characters in all diseases that cause tubular atrophy and fibrosis Atrophy and fibrosis of the tubules occurred without changes in the number of the interstitial cells The implications are that interstitial cellular hyperplasia is associated with tubular atrophy and fibrosis and not specifically with carcinoma

54 Sugar and the Opsonic Index

S KAPRAN and A SLINKO (*J med Acad Sci RSS d Ukraine*, vol vi, Fasc 2, p 403) have investigated the influence of prolonged ingestion of sugar on the opsonic index in animals infected with pyogenic staphylococcus They have also endeavoured to produce pyodermic lesions in these animals Their aim was to discover the causes of pyodermic lesions in workmen in sugar refineries Rabbits were given large quantities of sugar, with the following results The weight, after an initial rise, fell rapidly with the onset of gastro-intestinal disturbances The opsonic index fell rapidly and suddenly The authors ascribe the pyodermic lesion in workmen working in sugar refineries to repeated excessive ingestions of sugar, and probably also to a general excessive carbohydrate diet with insufficient intake of proteins

55 Lipids and Immunological Reactions

F L HORSFALL, jun, and K GOODNER (*J exp Med*, October, 1936, p 583) have made quantitative studies of the lipid content of specific precipitates prepared under varying conditions from Type I anti-pneumococcus horse and rabbit sera and the acetyl capsular polysaccharide of Type I pneumococcus With a fixed amount of antiserum and varying amounts of polysaccharide the lipid content of the specific precipitates was practically constant, while the protein content increased with increasing amounts of polysaccharide used With constant amounts of polysaccharide and varying amounts of antiserum both the lipid and protein contents of the specific precipitates per c cm of antiserum used increased as the amount of antiserum decreased In both cases the amount of lipid in the precipitates was independent of the amount of precipitate and of the amount of protein precipitated, it was, however, directly related to the amount of antiserum used thus suggesting that the greater part of the lipid in the precipitate was carried down as the result of adsorption This was confirmed by quantitative studies of the successive precipitates obtained by adding consecutive small amounts of polysaccharide to the antiserum, when the lipid content of the successive precipitates fell more rapidly than could be accounted for by the diminution in lipid concentration of the reacting mixtures

if Parliament enacted or the House of Lords decided that the surgeon could never be held liable for an act of negligence by one of the team The House of Lords does not often commit itself to a pronouncement of law which goes beyond the limits of the particular case it is deciding and it is equally difficult to imagine Parliament passing an Act exonerating all operating surgeons from vicarious negligence Moreover though a statement by the British Medical Association would undoubtedly be valuable it is difficult to see how it could ever be put in evidence as part of a surgeon's defence

The New Journal Typography

SIR—May I venture to offer you my respectful congratulations on the new format of the *Journal*—congratulations tinged perhaps with some small shade of regret Many years ago I had a cocker spaniel whose joy and pride it was to pick out your classic paper from a heap of the less excellent and to fetch it to me when asked to do so sometimes indeed asking to be asked On seeing the *Journal* in its new dress I thought of him, and wondered how long it would have taken the conservative little creature to recognize it in its new habiliment Some regret at the absence of the familiar he would have had but surely his good sense would soon have taught him that here was his old accustomed friend though dressed in other garb

There may be some who will regret the passing of the familiar (Some more time must wear the print of its remembrance out) but in its new guise the *B M J* has for me an added dignity in keeping with its great traditions and a clarity of type as pleasing as it is restful to the eye—I am etc

R McCARRISON

Oxford Jan 4

SIR—Hearty congratulations on the new format I like it and the superior blackness of the type appeals very strongly to one whose eyes are wearing out I don't say I shall read *more* of the *Journal*—I have always read a great deal of it—but I am sure I shall read what I do read with greater comfort—I am etc,

ALFRED COX

London W 1 Jan 5

SIR—As editor of the *Medical Women's Federation Quarterly Review* may I be allowed to offer congratulations upon the new aspect of the *British Medical Journal*? The new cover is a great improvement and looks extremely well especially as advertisements have been eliminated The types throughout are very clear and readable I am sure the change must meet with the approval of all members of the British Medical Association—I am etc,

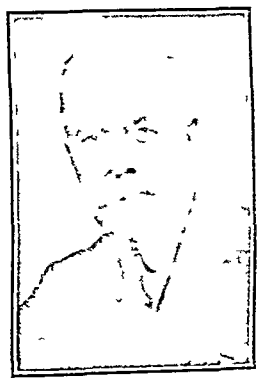
VIOLET KELYNACK

London W 1 Jan 8

SIR—May I add my thanks to those of your other correspondents? I expect that I am one of the most persistent of *B M J* readers and the new type and method of presentation literally doubles the value of the paper so far as I am concerned I know enough about these problems to realize the amount of thought knowledge and experience that has gone to the making of the *B M J* for 1937—I am, etc

HARRY ROBERTS

London E 1 Jan 9



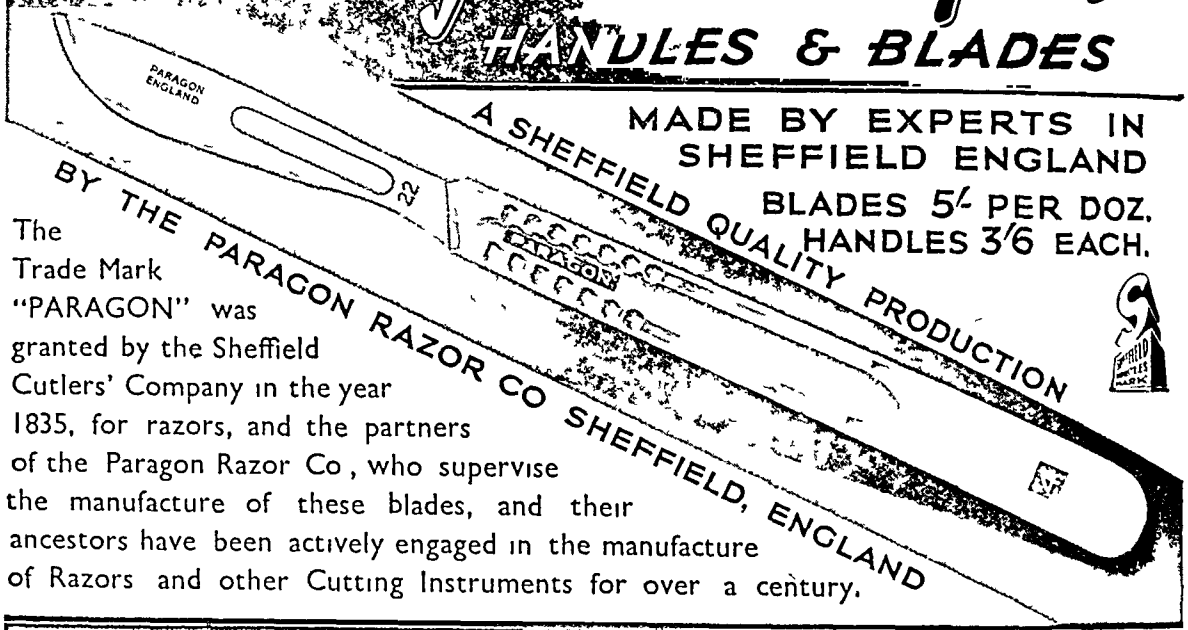
*** The letters printed above and those printed last week in this column are a small selection from many kind messages received since New Year's Day On behalf of everyone concerned in the change of typography we thank all the readers who have sent congratulations—ED *B M J*

Obituary

SIR DAVID SEMPLE M D D Sc

Lieutenant Colonel R.A M C (ret)

Lieut Colonel Sir David Semple R A M C (ret) died on January 7 aged 80 He was born on April 6 1856 the second son of the late William Semple of Castlederg County Tyrone and was educated at Foyle College Londonderry and at Queen's College Belfast graduating M D with honours and M Ch in the Royal University of Ireland in 1881 Subsequently he took the D P H at Cambridge in 1892 and in 1919 Belfast University conferred upon him the honorary degree of D Sc Entering the R A M C as surgeon on February 3 1883 he became lieutenant colonel after twenty years service and retired on June 14 1905 From 1904 to 1909 he was assistant professor of pathology at the Army Medical School Netley Then going for a tour of duty to India he founded the Pasteur Institute at Kasauli in 1900



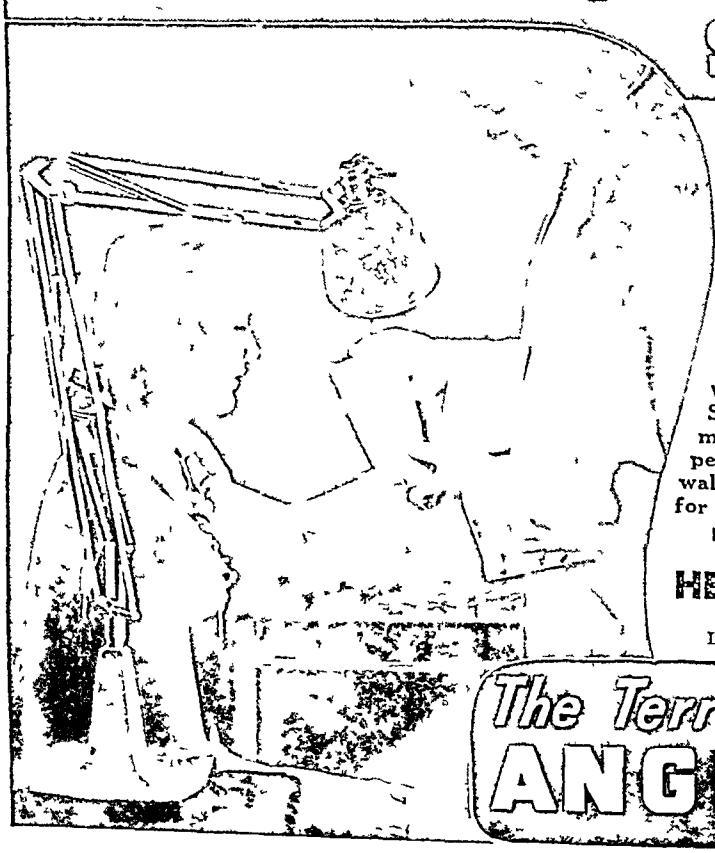
Before that time anyone bitten by a mad dog in India had to go for treatment to Paris a journey of three weeks In 1905 Semple became director of the Central Research Institute at Kasauli and held that post until 1913 when he went to Egypt as Director General of the Public Health Department in that country holding that post till the end of the war in 1918 In India he was a member of the Central Committee for the Study of Malaria from 1909 to 1912 and of the Scientific Advisory Committee on Medical Research from 1911 to 1913 while from 1915 to the end of the war he was a member of the Standing Sanitary Board of the Egyptian Expeditionary Force with the rank of colonel He received the Kaisar i Hind gold medal in 1903 and the Order of the Nile in 1918 and was knighted in 1911 He had been a member of the British Medical Association for over half a century since 1884 In 1894 he married Ethel May daughter of the late Dr Edward Watson of Isleham, Cambridge and had three daughters

SIR LEONARD ROGERS writes

Sir David Semple belonged to an early generation of tropical diseases research workers for after taking an honours medical degree in Belfast he entered the Army Medical Service in 1883 Early in the nineties he was stationed at Netley at the time Sir Almroth Wright began his brilliant researches at the Army Medical College and Semple in 1903 took a diploma in public health and studied bacteriology with the result that he was appointed assistant professor of pathology under Sir Almroth from 1904 to 1909 at a time when typhoid inoculation was being actively investigated as well as work at Malta on undulant fever Semple's work on immunology during that period naturally led to his being appointed a member of an important committee for the investigation of enteric fever in India Typhoid at that time was causing a far higher sickness and death rate in the British Army in India than any other disease and good water

"Paragon" Scalpel HANDLES & BLADES

MADE BY EXPERTS IN SHEFFIELD ENGLAND



A SHEFFIELD QUALITY PRODUCTION

BLADES 5/- PER DOZ.
HANDLES 3/6 EACH.

The Trade Mark "PARAGON" was granted by the Sheffield Cutlers' Company in the year 1835, for razors, and the partners of the Paragon Razor Co, who supervise the manufacture of these blades, and their ancestors have been actively engaged in the manufacture of Razors and other Cutting Instruments for over a century.

Obtainable from all the leading Surgical Supply Houses.

At last! The indispensable all-purpose SURGERY LAMP

This Anglepoise Lamp—the lamp of 1,001 angles—should be standard in every laboratory and surgery It pours a powerful concentrated light right on the subject

A PERFECT EXAMINING AND DRESSING LAMP

For sheer efficiency and convenience nothing can simply approach the ANGLEPOISE—adjustable to 1,001 positions at a finger touch—and poised at any angle

Simply marvellous for all "close" work as it throws the clear light necessary for extreme accuracy It can be brought as close as required Saves on light bills—a 25 watt bulb works like a 60!

Scientifically built—every part superlatively made Solid metal base, chromium plated arms, tireless springs—for perfect balance In several models Models for fixing to wall or table, and on smooth-running castors "A Triumph for Terry Springs"

From 50/- (U K only) *Patented at Home and Abroad*

Send to day for full information and Booklet B M J

The Terry ANGLEPOISE Lamp

torial Army Association He was twice president of the Penrith Literary and Scientific Society which elected him an honorary member four years ago Dr Bowser joined the British Medical Association in 1889 and was on eight occasions elected to the Border Counties Branch Council holding office as president in 1906–7 he had also been vice-chairman and chairman of the old North Cumberland Division and served on the Executive Committee of the English Division for seventeen years in succession During fifty years of active practice he had been medical attendant to many of the leading families in Mid Cumberland and North Westmorland

SIR HAROLD STILES writes

By the death of J Edward Bowser Penrith and the counties of Cumberland and Westmorland have lost an able and much beloved physician as well as a public spirited and universally esteemed citizen As a contemporary of his at Edinburgh I well remember the applause with which he was greeted by his fellow students when he gained the medal in Professor John Chiene's class of surgery He was subsequently awarded the much coveted Vans Dunlop scholarship in surgery and physiology (1884–7) There was no students union in those days but he was a prominent member of the Royal Medical Society he took an active part also in all that concerned the social and intellectual life of the student After taking the degrees of M B., C M he went to Penrith where he gave of his best for just half a century An able and cultured man with a commanding presence and courtly manner he soon gained the confidence alike of his colleagues and patients In his later years he became what may be termed a county consultant as well as the helpful counsellor and confidant of the junior practitioner

Bowser was a man who would have made his mark in whatever walk of life he chose to follow While in him surgery may have lost a valuable exponent when he became a general practitioner one feels that his many fine qualities and talents found a wider field of usefulness in that capacity He spared no pains to keep himself up to date and no sacrifice was too great where the welfare of his patients was concerned He greatly treasured a diamond tie pin bearing the Royal crest a gift from King Edward VII whom he attended when His Majesty visited the late Lord Brougham and Vaux at Brougham Hall in 1905

In addition to holding important civil medical appointments he was the regimental medical officer to the Cumberland and Westmorland Yeomanry retiring with the rank of surgeon major As chairman of the Voluntary Aid Committee he did valuable work both before and during the war and published an important monograph on The Territorial Army and the Transport of the Sick and Wounded He took a special interest in the treatment of fractures and was one of the first practitioners in this country to adopt the pioneer methods introduced by Championniere of Paris A well read man himself he took a delight in promoting the cultural welfare of his fellow citizens A good organizer and gifted speaker he made an admirable chairman at a public meeting He filled with great acceptance the important office of president of the Border Counties Branch of the British Medical Association Cautious and resourceful no one could wish for a wiser counsellor or a more reliable friend and with it all he possessed that keen sense of humour and wide knowledge of affairs which made him a delightful companion After a visit to Bowser at Penrith one always came away stimulated by his wide outlook and inspired by his devotion to the profession of which he was such an able and dignified representative

SIR GRAFTON ELLIOT SMITH

DR A J E CAVE assistant conservator of the Museum of the Royal College of Surgeons of England writes

The outstanding achievements of the late Sir Grafton Elliot Smith in the field of cultural anthropology may be less familiar to his medical brethren than are his pioneer investigations into mammalian cerebral anatomy or his important contributions to the physical anthropology of primitive and of fossil man Yet his influence in this particular field (one of increasing social and politico-economic importance) has been as profound as that of a Darwin or a Huxley in realms biological indeed no more may the modern ethnologist neglect a thoughtful recognition of Elliot Smith's doctrine of the diffusion of culture than the present day biologist may dispense with some scheme at least of organic evolution

The potent influence which Elliot Smith was later to exert had its seeds in his chance occupancy of the Cairo chair of anatomy which brought him into close and sympathetic co operation with the foremost Egyptian archaeologists of his day (Maspero Junker Reissner Mace Quibell Theodore M Davis and others) and gave him an unrivalled acquaintance with Egyptian cultural elements of all periods of that country's history His anatomical skill was sought increasingly in the description and recording of extensive series of human remains (cf his contributions to the *Bulletins of the Archaeological Survey of Nubia*) and in the examination of mummified and other mummies the volume on *The Royal Mummies* of the Cairo Museum Catalogue being from his pen His numerous memoirs on mummification (continued in after years) not only gave us the first truly scientific and comprehensive analysis of this curiously distinctive practice but also focused their author's attention sharply upon a ritual which he recognized as constituting the central nucleus of the whole of ancient Egyptian civilization Elliot Smith intuitively perceived in the practice of mummification one of the master themes of cultural anthropology a theme which he expanded and elaborated in later years to most fruitful purpose It was originally from the mere geographical distribution past and present of this peculiar and difficult practice that he demonstrated (1915) *The Migrations of Early Culture* a classic of ethnological accomplishment

He increasingly sought with his colleague Dr W J Perry and the disciples they gathered about them corroborative evidence of the actual spread of cultural elements and customs from one original home and while such evidence accumulated he proclaimed with characteristic fullness and vigour his provocative ethnological doctrine of the diffusion of culture Tremendous even bitter was the opposition to this novel teaching and the echoes of conflict are still about our ears But in the main the old fallacy of a basic psychic unity underlying human activities and reactions was exploded and the gist of later anthropological investigation has been a confirmation of the truth and reality of the main tenets at least of the diffusionist gospel and of Elliot Smith's penetrating conception regarding the fundamental uniformity of early civilizations The whole face of ethnological study has been renewed and a new and vivifying spirit infused therein

It is to Elliot Smith's lasting credit that he first with an intuition transcending the merely anatomical perceived in ancient Egypt the essential threads of primitive culture and civilization and out of them wove on the loom of his genius the tapestry of human history

for RELIABILITY

'VARIBAN' ELASTIC PLASTER BANDAGE

'VARIBAN' BANDAGE constitutes a marked advance on the older methods of treating chronic ulceration of the leg It is made from a specially woven selvedge material possessing highly elastic properties, and is impregnated with an antiseptic zinc oxide paste

"VARIBAN" is self-adhesive and combines the principles of firm equable pressure and support to the swollen leg with the benefit of an occlusive dressing under which the ulcer is protected and is stimulated to healthy repair

In promoting proper circulation "VARIBAN steadily reduces oedema It provides protection to the granulations of the healing ulcer In the majority of cases it is found that pain is either eliminated or greatly relieved from the first application The necessity for ointments lotions, etc is obviated, while 'VARIBAN' provides an ambulatory treatment which allows of full activity of the limbs with better results than those following rest in bed alone

CURTIS ABDOMINAL SUPPORT No 1

Gives Scientific support without Constriction

The anterior posterior pressure of the Curtis Abdominal Support No 1 is recognised as the most satisfactory method of giving support to the lower abdomen without employing undue circumferential pressure The support is light in weight and scientifically designed to give greater freedom to the hips than any other It is unhesitatingly prescribed by medical men as the most efficient support for all forms of Abdominal Ptosis

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

37 Myasthenia Gravis

H N HYLAND (*Canad med Ass J* October 1936 p 372) analyses in six severe cases the treatment of myasthenia gravis by modern methods The patients three males and three females of ages 17 to 31 all showed ptosis diplopia and great weakness of the facial muscles preventing speech and rendering eating difficult All had general muscular weakness two patients a female of 21 years and a male of 29 years being bedridden Periodic remission of symptoms had been noticed in each case prior to treatment while minor infections emotional stress gastro intestinal disturbances and in one case menstruation were liable to increase the fatigability and weakness of the affected muscles He found that (*a*) X-ray irradiation of the thymus in three applications of 800 *r* units was effective in bringing about remissions of two months to two years in the four cases treated (*b*) (1) Glycine by mouth in doses of 5 to 15 grains three times a day gave symptomatic benefit in four out of six cases one patient aged 19 years having an uneventful pregnancy and satisfactory delivery of a 7-lb child, (2) glycine intravenously 15 grains in 100 c cm of saline gave less benefit. (*c*) Ephedrine had little value alone but administered with glycine and pushed to the limit of tolerance at 1½ grains daily was shown to be of some use (*d*) Physostigmine salicylate and antuitrin intramuscularly were not found satisfactory (*e*) Prostigmine in doses of 2·2 c cm with atropine 1/150 grain produced a startling but temporary improvement for several hours with greater muscular fatigability after the effect wore off suggesting mainly an emergency use Hyland thus shows that with modern methods in the treatment of myasthenia gravis a normal active life is possible in some cases with definite symptomatic improvement in all cases and good prognosis for life

38 Parathyroid Adenoma and Renal Insufficiency

BENJAMIN M BAKER and JOHN E HOWARD (*Johns Hopk Hosp Bull* October, 1936 p 251) report a case of parathyroid adenoma with renal insufficiency Since Pappenheimer and Wilens found at necropsy an increased mean weight of the parathyroid gland in twenty seven patients with a severe but diffuse nephritis the association of renal disease with adenomata of the parathyroid seems to be too common to be merely a coincidental finding Their patient was a well built male school teacher of 45 years who had previously complained of asthma for twenty one years and intermittent duodenal dyspepsia In March 1933 he had developed cramping pains in the legs and feet In March 1934 he suffered from a severe lobar pneumonia with exacerbations of the cramps, from which he imperfectly recovered In March 1935, the patient became weak restless, and depressed The pains in back, legs, and epigastrium were continuous vomiting was incessant, and the eyes were red swollen and intolerant to light He was admitted to the Johns Hopkins Hospital with a diagnosis of uraemia On examination the temperature was 98·6° F, pulse 65 blood pressure 135/100 with gross muscular wasting The eyes showed pigmentation of the periorbital tissues and severe episcleritis There was no enlargement of the thyroid The urine had a specific gravity of 1010 Some albumin and white blood cells and hyaline casts were present A blood count showed red blood cells 3 600 000 72 per cent haemoglobin serum calcium 19·3 mg per cent serum phosphate 4·5 mg per cent blood urea 80 mg per cent On x-ray examination osteoporosis of the tibiae femora and forearm bones was found Parathyroid tumour having been diagnosed subtotal parathyroidectomy was performed through a collar incision under gas and oxygen A yellow cystic tumour of walnut size was removed from the right side, while microscopical examination showed adenomatous cell formation The patient improved immediately Twenty four hours after operation the serum calcium was 17·3 mg serum phosphate 5 mg blood urea 50 mg The pain lessened and though slow improvement was progressive and in December 1935 the patient returned home Three months after operation he walked four miles daily and had a normal appetite and good eyesight Only the asthma persisted The blood urea was 44 mg urinary specific gravity 1024 This improvement in renal function after removal of the tumour was more marked than has previously been described by Albright and co workers and by Elsom Wood and Raydin and the authors conclude on theoretical grounds that generalized nephrocalcinosis was the cause of the insufficiency and that such a process at certain stages may be reversible

Surgery

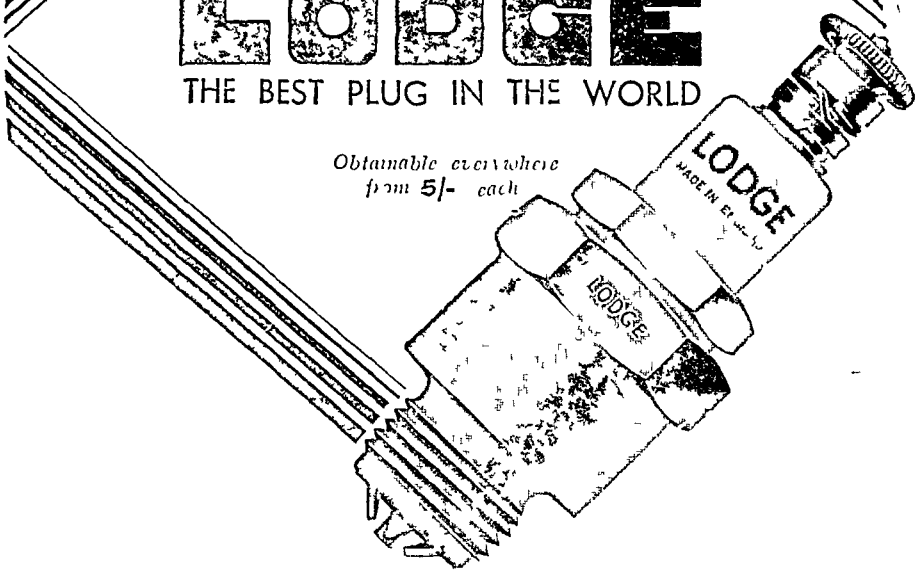
39 Bassini's Operation

K BARTH (*Zbl Chir* November 21 1936 p 2771) reports the results of 1 117 cases of inguinal hernia treated by the operation of Bassini The original Bassini method was followed It presents a number of advantages It saves time as five to ten bleeding points may be attended to simultaneously It is cheaper as no expensive catgut is used and it prevents wound infection and therefore prevents recurrences The author describes in detail the operative technique Of the 1 117 cases that had been operated upon 494 could be traced Only seven of these had recurrences of the hernia

40 Congenital Stenosis of Small Intestine

L W VAN OUWERKERK (*Nederl Tijdschr Geneesk* November 7 1936 p 4992) who reviews the literature and records six personal fatal cases maintains that stenosis and obliteration of the duodenum jejunum or ileum are not so rare as is supposed The length of gut affected may vary In 15 per cent of the cases the atresia or stenosis is multiple In about a third of the cases the duodenum is affected either above or below Vater's papilla or as a whole In two of the writer's cases the duodenum in two the jejunum and ileum and in two the gut in the region of the ileo caecal valve were involved Early operation affords the only chance of recovery as in the cases reported by Schroder Hutchison and Dimmer

41 Transurethral Prostatic Resection



E KINDT (*Ugeskr Laeg* October 15 1936 p 981) compares the popularity enjoyed in the USA by transurethral resection of the prostate with the reserved attitude shown towards it in Europe Here the lack of enthusiasm may in part hinge on failure to realize that the encouraging results achieved by the Americans have been at the cost of a meticulous technique on the part of all concerned not least the assistants and nurses The author's experience is of fifty patients thus treated Although some of them were in poor health and their renal functions were defective there were only five deaths and of these only two could be directly traced to the operation With regard to the indications the author is disinclined to adopt a very high renal or general standard considering that such alternatives as the catheter life or a suprapubic fistula warrant the taking of considerable risks The only absolute contraindication o a trans-

Ophthalmology

46 Papillomata and Tumours of the Lids

J MINTON (*Brit J Ophthal* November, 1936, p 624) reports that the removal of papillomata is a simple matter with an electrolysis needle and a galvanic current of 3 to 4 milliamperes as is used for the epilation of lashes A curved or straight steel needle is better than the pliable platinum needle Under novocain anaesthesia the base of the tumour is cauterized by inserting the needle through it in various directions and passing the current for a few seconds The papilloma is then snipped off without any haemorrhage A collodion dressing is applied and after a week the lid is healed without any scar Cysts of Moll's glands small sebaceous cysts xanthomata conjunctival concretions and granulomata and naevi of the skin all respond to this form of treatment

47 Minor Sequelae of Eye Contusions

M DAVIDSON (*Amer J Ophthal* September 1936 p 757) points out that the grosser eye injuries are rarely untreated or the subject of serious legal controversy Minor injuries often neglected or referred to an oculist after a lapse of time are frequently the cause of contention They are not amply described in textbooks About 5 per cent of the cases seen at the New York Bureau of Workmen's Compensation were contusions of the eye Thirty four of such cases leaving out the major contusions are considered For discovering defects in the iris diapupillary retro illumination with the slit lamp without the use of the microscope is of the greatest value Brown deposits on Descemet's membrane, except in the presence of complicating uveitis, are so rare in contusion as to be of use in the differential diagnosis even when a prolapsed knuckle of vitreous in the anterior chamber is peppered with pigment Traumatic iridoplegia is rarely seen in posterior pole injuries but it is frequent with dehiscences of the iris pigment at its root (which are often overlooked) in contusion of the anterior segment In the lens, Vossius's ring may have practically disappeared in three months A small tenuous striated permanent subcapsular opacity is frequently seen often under the iris corresponding to the depigmented iris sectors Retrolenticular, rather large bright red particles are characteristic The minor foveal stippling whitish or pigmented and the parafoveal yellowish or faintly pigmented patches due to contrecoup may be missed unless looked for by the indirect method Peripherally pigmented lesions similar to luetic anterior choroidoretinitis or atypical retinitis pigmentosa are observed

48 Treatment of Strabismus

J L BRESSLER (*Arch Ophthal* Chicago September 1936, p 433) describes the treatment of squint at the Illinois Eye and Ear Infirmary There is a period of three to six months observation after the provision of glasses in which an attempt is made to cure any amblyopia If suitable, orthoptic training is then begun, but if not then operation is ordered Orthoptic training is started five to ten days after operation The results are greatly influenced by the pre operative treatment and the proper selection of operative procedure Mere straightness of the eyes without stereopsis is regarded as a failure 218 cases are divided for consideration into three groups (1) operation only, (2) operation followed by orthoptic training (3) operation preceded and followed by orthoptic training The cases were unselected In Group 1 32 per cent were straight and 8 per cent had fusion In Group 2, 6 per cent were straight before and 47 per cent after training, 9 per cent fused before and 75 per cent after training In Group 3, 19 per cent fused before operation 56 per cent were straight after operation and 81 per cent were able to fuse In many of the cases where nothing was done to the internal rectus motility was limited and fusion difficult The best results were obtained by retroplacement of the internal rectus Few patients obtained fusion after Tucking operations even though the eyes were straight The analysis shows the value and efficiency of orthoptic training in conjunction with operation

49 Sympathetic Ophthalmia

H H JOY (*N Y St J Med* October 15, 1936 p 1498) examines the incidence of sympathetic ophthalmia in published statistics It is infrequent after both intra ocular operations and injuries In cataract operations the percentage varies from 0 027 to 2, and together with the figure for glaucoma is higher than in any other operation Sympathetic ophthalmia may occur despite any prophylactic preparation—a technique causing no undue post operative uveitis is the best safeguard An iris prolapse should be excised in the early stages but should if well covered be left alone later Repeated operations increase the risk, as do lenticular remains after the extraction of a cataract Iridencleisis operations for glaucoma are not without danger whereas trephine operations are remarkably free from this complication In many cases of the disease some pathological state has been found unrelated to the condition for which the operation was done

Gynaecology

50 Mortality in Hysterectomy for Fibroma

A GOSSET and P FUNCK BRENTANO (*Gynecologie* October, 1936 p 577) state that in supravaginal hysterectomy done between 1913 and 1934 for simple fibroma or fibroma complicated by salpingitis the mortality was 2 7 per cent The series include 1,170 cases operated on at the Salpetriere, with six deaths from pulmonary complications fifteen from general or peritoneal infection two from pelvic cellulitis and fifteen from embolus Further reductions of mortality will be possible they think when pre operative examination of the patient and also the choice of the anaesthetic receive further attention Pre operative examinations should include radiography of the chest measurement of blood pressure a Wassermann test a red and white blood cell count, and estimation of blood coagulation time Avoidance of pulmonary complications is assisted by lung radiography, which may decide against ether anaesthesia and call for a spinal anaesthetic this last is especially suitable in the patient with increased blood pressure (common in those with fibroids) but inadvisable in those with a positive Wassermann reaction To avoid infection pre operative search must be made for a subinfectious state of the patient she may be quite apyrexial but blood examination may show a leucocytosis of 15 000 to 20 000 In such conditions a polyvalent or Delbet broth vaccine is given and has diminished the incidence of thromboses Drainage is advised in every supravaginal hysterectomy and in acute *B coli* post operative peritonitis with hyperpyrexia and copious discharge of a thin non purulent and non odorous liquid the writers believe that the patient's life may sometimes be saved by injection through the drainage tube of 40 c cm of Vincent's antiserum Post operative embolus is regarded as occurring especially among those with a subinfectious state which may be masked clinically but is indicated by leucocytosis with a diminished coagulation time and with a thrombotic focus in the pelvic veins The preventive measures which are respectively advised in connexion with these conditions are (1) pre operative vaccination (2) application of leeches to the thigh and the administration of citrates and (3) the ligature of the vascular pedicles without previous application of clamps

RELIEF FOR CHILBLAINS

For subcutaneous injection (5,000 international units of vitamin D and 0·5 mgm of colloidal calcium per cc)

Colloidal Calcium with Ostelin has been found, in practice, to be almost a specific in the treatment of chilblains Even the worst cases can be helped through the winter in comfort and without disability, and the skin circulation can be brought to a natural state In many cases the pain, irritation and swelling subside after the first injection The usual procedure is to give 2-3 injections of 1 cc at 3-day intervals, but in chronic cases six such injections may be needed As a useful adjunct to this treatment, and to protect against recurrence, the routine oral administration of calcium and vitamin D (Ostocalcium Tablets) has proved most successful Each Ostocalcium Tablet contains 7½ grs of calcium sodium lactate together with 500 international units of vitamin D

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER, G.M.C., A.D.C.

Medical Superintendent DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological, and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE.

This is a Reception Hospital in detached grounds with a separate entrance, to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special department[illegible]ous methods including Turkish and Russian baths, the prolonged imme[illegible]otch Douche, Electrical bath, Plombieres treatment, etc. There is an[illegible]Surgery, an X-ray room, an Ultra-violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit growing.

BRYN-Y-NEUADD HALL.

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton), who can be seen in London by appointment.

HAYDOCK LODGE,

NEWTON-LE-WILLOWS, LANCASHIRE,

Telegr. Street, Ashton-in-Makerfield. *Phone* Ashton-in-Makerfield 7311.

For the reception and treatment of PRIVATE PATIENTS of both sexes of the UPPER AND MIDDLE CLASSES suffering from mental and nervous diseases, either voluntarily, temporarily, or under Certificate. Patients are classified in separate buildings according to their mental condition.

Situated in park and grounds of 400 acres. Self-supported by its own farm and gardens, in which patients are encouraged to occupy themselves. Every facility for indoor and outdoor recreation. For terms, prospectus, etc., apply MEDICAL SUPERINTENDENT.

COURT HALL, KENTON, near EXETER,

for the treatment of eight Ladies, voluntary, temporary or certified patients

Large gardens and own dairy

CLIFTDEN, TEIGNMOUTH for early and convalescent cases. A well-appointed house, with spacious balconies and extensive views of the South Devon Coast. Sub-tropical gardens, own dairy in 25 acres. Private road to beach.

Resident Physicians { BERTHA M. MULES, M.D., B.S. / ANNE S. MULES, M.R.C.S., L.R.C.P.

Telephones: Starcross 59, Teignmouth 289

NORTHUMBERLAND HOUSE,

GREEN LANES, FINSBURY PARK, N.4

A PRIVATE HOSPITAL for the treatment of mental and nervous illnesses. Conveniently situated and easy of access from all parts. Six acres of ground, highly situated facing Finsbury Park. Voluntary and Temporary Patients received without certification. Occupational Therapy, Psychotherapy, and other modern forms of treatment.

Telephone: STAMFORD HILL 2688. Telegrams: SUBSIDIARY, LONDON.

Convalescent Home: KEARSNEY COURT, DOVER. For further particulars apply to the Medical Superintendent.

THE COPPICE, NOTTINGHAM.

HOSPITAL FOR MENTAL DISEASES

This Institution is exclusively for the reception of a limited number of Private Patients of both sexes of the Upper and Middle Classes at moderate rates of payment. It is beautifully situated in its own grounds on an eminence a short distance from Nottingham, and from its singularly healthy position and comfortable arrangements affords every facility for the relief and cure of those mentally afflicted. Occupational Therapy. Voluntary and Temporary Patients received. *Tel.* 6[illegible]. *For terms etc. apply to the Medical Superintendent.*

BARNWOOD HOUSE

GLOUCESTER

A REGISTERED HOSPITAL for the CARE and TREATMENT OF LADIES and GENTLEMEN suffering from NERVOUS and MENTAL DISORDERS. Within two miles of the G.W. Railway and L.M. & S. Railway Stations at Gloucester. The Hospital is easily accessible by rail from London and all parts of the United Kingdom. It is beautifully situated at the foot of the Cotswold Hills and stands in its own grounds of over 300 acres. Voluntary Patients of both sexes are also received for treatment.

Special accommodation for Lady Voluntary Patients is also provided at the MANOR HOUSE which has its own private ground and is entirely separate from the Main Hospital.

For particulars as to terms etc. apply to—ARTHUR TOWNSEND, M.D., Medical Supt. Telephone No. 6207, Barnwood.

HILL END HOSPITAL

FOR MENTAL AND NERVOUS DISORDERS

(20 miles from London)

Salt and Son Ltd

A SUCCESSFUL SOLUTION TO A PSYCHOLOGICAL PROBLEM . . . .

SALTAIR ARTIFICIAL BREAST & BRASSIERE

Amputation of the breast formerly resulted in a psychological reaction which has given much concern to the medical profession The embarrassment felt by the patient almost inevitably led to a more or less complete curtailment of those social pleasures which are an essential to physical well being But now THE SALTAIR ARTIFICIAL BREAST completely banishes all cause for self consciousness This Surgical Fitting reproduces the normal and natural line of the breast It is very resilient has a beautifully smooth surface and weighs only two ounces It retains its shape when wet and is easily dried so that bathing can be enjoyed with confidence There is also a SALTAIR BRASSIERE—an accurately cut foundation garment with a shaped pocket in which the Breast is firmly held whilst correct support is also given to the natural breast Fuller details will be sent post free to any Doctor

An Endocrine Prescription *in* Dysmenorrhea *and* Amenorrhea

You can write an endocrine prescription in one word—a proper combination of the endocrine principles which are now known to initiate and control the menstrual process. Your prescription will have the advantage of being filled with fresh potent endocrine constituents. The formula is in accord with the most recent research on the endocrine glands concerned in regulating menstruation.

Elastoplast in the treatment of varicose ulcers

If the foot and leg be bandaged with the appropriate Elastoplast Bandage the patient can remain at work The bandage will probably need changing in 4-6 days The next bandage can probably remain in position for 7-10 days Then the patient and physician alike will be delighted at the reduction in the size of the ulcer, which can be compared with the tracing of the ulcer taken at the beginning of treatment, before any bandages were applied The experience of Practitioners has been that varicose ulcers when treated in this way, heal at an average rate of one square inch per week

Full details will be found in "Elastoplast Technique," a copy of which will be forwarded on request to the address below

Practices and Partnerships for Disposal (continued)

19 LONDON, S.W.—Partnership in old established PRACTICE in pleasant residential suburb. Receipts about £2,000 p.a. including about £400 from panel. Visits 5/- to £1 1s. Small house (3 bedrooms) with garage and fair-sized garden. Rent £50 p.a. One-third share for disposal at two years purchase.

20 LONDON, N.W.—Well-established Practice in desirable residential district. Receipts average £767 p.a. Building panel about 240. Visits 5/6 upwards. Modern semi-detached House (4 bedrooms) with garage and garden. Price of leasehold £1,600. Very good scope. Premium £1,150.

21 N.E. COAST.—Well-established middle and upper middle class PRACTICE averaging £1,150 p.a. in important city. Panel 670. Visits 5/6 to 7/6. No midwifery. House in residential part (recently redecorated) containing 4 bedrooms, 2 attics, etc., garage and small garden for sale or rent. Premium one and a half years purchase.

22 HOME COUNTIES.—Old established Practice of £500 p.a. in first-rate town 20 miles from London. Panel over 900. Visits 5s. No midwifery. Modern nine-roomed house with garage and attractive garden—about quarter of an acre. Premium freehold house and Practice £2,500.

23 LONDON, S.E.—Well established Practice in suburban district. Receipts average over £650 p.a. including appointments worth £80/£100 p.a. and a panel of 535. Semi-detached house (12 rooms) with garden for sale. Scope. Premium one and a half years purchase.

24 LONDON, S.E.—Increasing Middle class Practice in pleasant suburb. Cash receipts past twelve months £1,270. Panel 950. Visits 3/6 to 7/6; medicine sometimes included. Detached double-fronted house with ample accommodation for sale or rent. Further scope for increase. Premium £2,400.

25 MIDDLESEX.—Nucleus of Practice in rapidly developing residential district about fifteen miles from London. Receipts last year £570. Fairly run corner residence (4 bedrooms) with garage and garden. Premium house and Practice £1,000.

26 LONDON, W.—Practice of about £700 p.a. in residential district. Panel 500. Large corner house (7 bedrooms) with separate surgery entrance and good garden. Price of lease £1,350. Scope. Premium £1,250.

27 ESSEX.—Old established Practice in outlying suburban district run by two medical men averaging nearly £2,900 p.a. Panel 2,849. House (4 bedrooms etc.) for sale or rent. Premium two and a quarter years purchase.

28 S. OF ENGLAND.—Partnership (after Preliminary Assistantship) in old established Practice of about £3,500 p.a. in an important town. Appointments £250. Suitable house available to rent. A one-third share would be sold at two years purchase to a suitable man, preferably one holding the M.D. or M.R.C.P.

29 LONDON, S.E.—Old established Practice of about £1,000 p.a. in outlying residential district. Panel 100. Detached house (4 bedrooms etc.) for sale. Premium two years purchase.

30 MIDLANDS.—Old established Practice of about £930 p.a. in country district. Panel 530. House (7 bedrooms etc.) for sale. Premium two years purchase.

31 S. COAST.—Partnership in old established PRACTICE of about £1,630 p.a. in fashionable health resort. Panel 1,300, and appointments worth £150 p.a. Detached house with garage and garden for sale or to rent. Premium for one-third share two years purchase.

32 LONDON, N.—Old established Practice in suburban district. Cash receipts 1936 (10 months) £1,450. Panel 1,240, increasing. Fees 2/6 upwards. Suitable house (9 rooms) to rent at £160 p.a. Premium £3,400.

33 HOME COUNTIES.—A small Practice about £400 p.a. in first-rate town about 30 miles from London. Panel 140. Visits mostly from 5/-. House with small garden to rent 25/- weekly. Excellent scope. Premium one and a half years purchase.

34 CHESHIRE.—Partnership in Practice averaging over £8,500 p.a. in good class residential neighbourhood of a town. Panel 2,000. Visits 4 to £1 1. Partner should be aged about 30, hold University degree, have held House appointment and experienced in midwifery and anaesthetics. One-eighth share at first at two years purchase. Preliminary Assistantship.

35 N. MIDLANDS.—Partnership in old established country Practice averaging over £5,000 p.a. close to county town. Panel over 1,800. Visits 3/6 to 10/6 and a few at £1 1/- Medicine extra. Specially built house in very pleasant district (6 bedrooms), garage and quarter-acre garden for sale or might be rented. Scope for increase. A building scheme is going on. Premium one-third share two years purchase to include share of drugs, etc.

36 HOME COUNTY.—Partnership in old established non-dispensing Practice averaging £2,000 p.a. in good residential district within 15 miles of London. Small Panel. Suitable house (4 bedrooms) to rent. Incoming partner should preferably hold the M.R.C.S. and there is a possibility of a shop appointment. From 9 to 12 months two-year purchase.

37 S. COAST.—Practice doing about £400 p.a. in rapidly growing castle place. Panel 60. Detached house with 4 bedrooms, garage and good garden, rent £90 p.a. Good scope, building going on. Premium £450.

38 EAST COAST.—Partnership in well established Practice in seaport town. Receipts about £3,200 p.a. including good appointments and a Panel about 300. Corner house (3 bedrooms) for sale or rent. One-fourth (possibly one-third) share two years purchase.

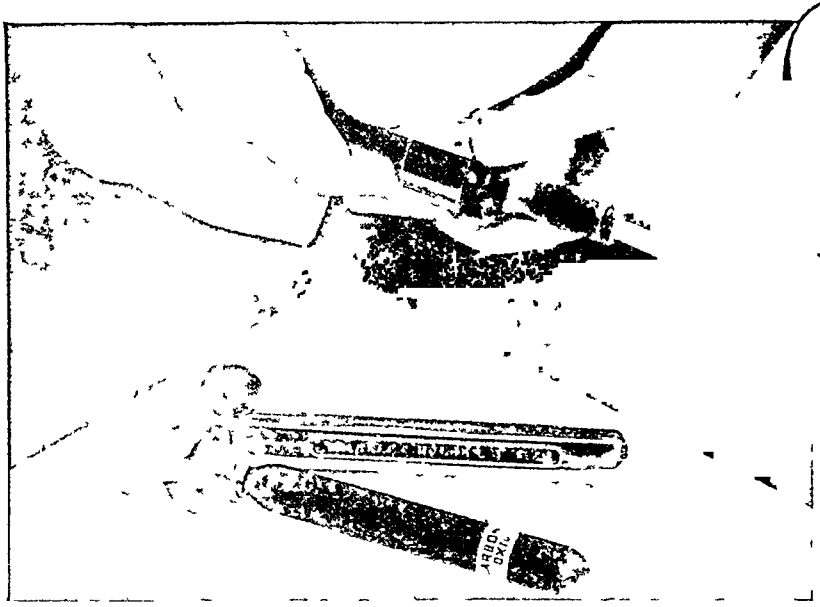
39 WELSH COAST.—Old established country and seaside Practice. Cash receipts average £650 p.a. including appointments and Panel 272. Visits 5/- to 7/6. Not much midwifery. Suitable accommodation could be had. Bathing, boating, sailing, etc. Premium £750.

40 HAMPSHIRE.—Practice averaging £830 p.a. in nice residential district, easy distance of the coast. Panel 400. No midwifery. Semi-detached house on main road with good garden for sale. Scope. Premium £1,500.

41 LONDON, S.W.—High class non-dispensing PRACTICE about £1,000 p.a. in residential district close to Mayfair. Fees £3/3/- to £5/5/-. Excellent accommodation for purposes of practice; rent £200 p.a. Scope for increase. Premium one and a half years purchase.

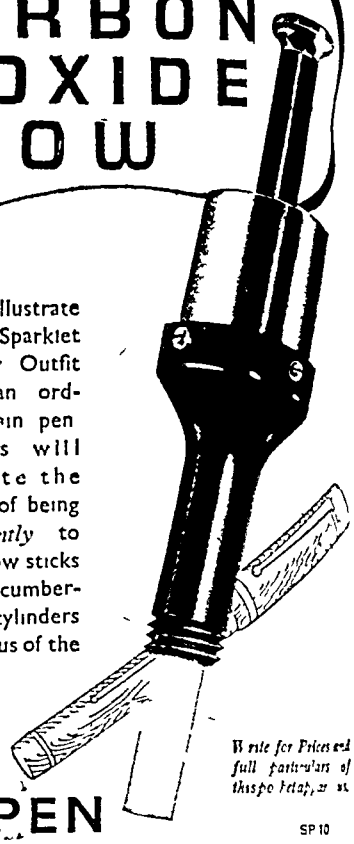
42 LONDON, N.—Medical Woman's Practice in populous district. Receipts average about £560 p.a. including Panel 470. House with 4 bedrooms etc. to rent at £100 p.a. on lease. Premium £1,000.

43 LONDON, S.E.—Old established Practice averaging over £850 p.a. in thickly populated district. Panel 1,188. No midwifery. House on main road (4 bedrooms) with separate entrance to surgery; accommodation for sale or rent. Good scope. Premium £1,700.



44 SOUTH AFRICA.—Medical Woman's Practice in one of the principal towns. Cash receipts last 12 months £1,350. House could be rented. Scope. Premium £850 cash.

45 N. LONDON.—Established Practice doing about £450 p.a. in a growing outlying residential district. Panel about 600. Well-situated house on main road to rent. Good scope. Premium £650.



Purchasers for cash are available for Practices with Incomes of £1,250 to £2,000 p.a.
Purchasers can raise additional capital for the purchase of approved practices or shares.
Particulars will be forwarded on application.

A number of Assistantships can be offered to suitable applicants.

INFRA-RED RADIATION
IN GENERAL PRACTICE
The "Duo-Ray" Apparatus

The present wide spread interest and use by the medical profession of this method of treatment is undoubtedly due to the remarkable results attending its application primarily in RHEUMATIC AND ALLIED DISORDERS, FIBROSITIS, SCIATICA, LUMBAGO, NEURITIS, SPRAINS, BOILS AND CARBUNCLES PYLOROSPASM, ETC INSOFAR AS RHEUMATIC AND ALLIED DISORDERS ARE CONCERNED, THE EXTRAORDINARY RELIEF OF PAIN BY HEAT RAYS IS ABUNDANTLY CONFIRMED IN THE COMPREHENSIVE SURVEY INDICATED IN THE REPORT OF THE B M A COMMITTEE ON THE CAUSATION AND TREATMENT OF ARTHRITIS AND ALLIED CONDITIONS (see *B M J*, June 17th, 1933)

There is nothing new in the application of infra red radiation It is but the logical sequence of the epoch making discovery of Prof Finsen in 1883 The apparatus here described is the product of research for a simple yet highly efficient apparatus for the convenient application of this form of radiation, devoid of unnecessary elaboration, perfectly safe in use and at a very moderate cost It is supplied in two models, one with fixed base and the other with collapsible base for visiting cases A long wave infra red non luminous generator with an interchangeable luminous heat bulb is provided Price complete for either model is 95/6

IMMEDIATE DELIVERY CAN BE GIVEN

CATALOGUE No B 106 FULLY DESCRIBING THE DUO RAY APPARATUS WILL BE GLADLY FORWARDED ON REQUEST

SULPHONAMIDE-P B.D.H.

(para-amino benzene-sulphonamide)

For oral administration
in hæmolytic streptococcal infections

Sulphonamide-P is the name given by the B D H to p-aminobenzene-sulphonamide Clinical evidence shows that this substance possesses remarkable bacteriostatic and bacteriocidal activity against hæmolytic streptococci even when administered orally

It is employed in the treatment of puerperal septicaemia and erysipelas and in other conditions due to infections of hæmolytic streptococci such as scarlet fever, tonsillitis, etc It has also a wide prophylactic use

Sulphonamide-P B D H is available in tablets each containing 0 5 gramme of the pure substance

Literature on request

THE BRITISH DRUG HOUSES LTD LONDON N1

Sul P/S/1

VEGANIN BRAND TABLETS

MADE IN ENGLAND

VEGANIN Brand Tablets present a carefully-balanced combination of Phenacetin, Acetyl-Salicylic Acid and Codeine

Their beneficial effect in Influenza and other Respiratory Affections affords striking justification for Burgi's synergistic theory that certain combinations of two or more therapeutic agents of differing, but related, pharmacological action, increase the individual effectiveness of each

A supply for Clinical Test will be gladly sent on request to Members of the Medical Profession

Recent Advances Series

Ten Latest Volumes

By F. H. Burns, B.Ch., F.R.C.S. and V. H. Ellis, B.M., F.I.C.S.

ORTHOPAEDIC SURGERY

108 Illustrations. 15/-

A discussion on the present attitude towards certain problems of Orthopaedic Surgery.

By C. Lyndon Hewer, M.B., B.S., D.A.(P.C.P.), L.R.C.S.

ANAESTHESIA AND ANALGESIA

2nd Edition. 113 Illustrations. 15/-

Some idea of the rate of progress in Anaesthesia may be gained from the fact that in an interval of five years has necessitated the virtual rewriting of this book.

By C. D. Darlington, D.Sc., Ph.D.

CYTOLOGY

2nd Edition. 16 Plates, 160 Text figures and 81 Tables. 21/-

Every serious student of cytology and genetics will find it indispensable.—ANNALS OF APPLIED BIOLOGY

By G. W. Pearce, M.B., M.P.C.P.

ALLERGY

(Asthma, Hay Fever, Eczema, Migraine, etc.)

3rd Edition. 107 Illustrations. 15/-

This book has established itself as the foremost textbook on Allergy in this country.—THE MEDICAL PRESS AND CIRCULAR

By A. T. Cameron, D.Sc., F.I.C.

ENDOCRINOLOGY

3rd Edition. 65 Figures including 3 Plates. 15/-

Those who wish to pursue the study of Endocrinology cannot do better than procure this excellent handbook.—THE LANCET

By Peter Kerley, M.D., B.Ch., D.M.R.E.

RADIOLOGY

2nd Edition. 176 Illustrations. 15/-

The bibliography makes this book one of reference as well as being the most up-to-date and easily read work on radiology.—THE MEDICAL PRESS AND CIRCULAR

By Hamilton Bailey, F.R.C.S., and W. Wathen Wade, M.B., F.I.C.S.

GENITO-URINARY SURGERY

89 Illustrations. 15/-

A high standard has been achieved. It can confidently be predicted that this latest number will worthily uphold the traditions of the Recent Advances series.—THE PRACTITIONER

By W. Noel Gold smith, M.D., M.P.C.P.

DERMATOLOGY

8 Coloured Plates and 50 Text figures. 18/-

This is a most notable contribution to medical literature. . . . It will certainly find a place at the right hand of every dermatologist.—THE PRACTITIONER

Revised by W. H. Newton, M.D., M.Sc.

EVANS' PHYSIOLOGY

5th Edition. 120 Illustrations. 15/-

Is sure to receive the usual hearty welcome.—BRITISH MEDICAL JOURNAL.

By G. E. Beaumont, D.M., F.R.C.P., and E. C. Dodds, M.V.O., M.D., F.R.C.P.

MEDICINE

8th Edition. 46 Illustrations. 12s. 6d.

Of all the members of Churchill's popular series "Recent Advances in Medicine" has had undoubtedly the most deserved and greatest success.—BRITISH MEDICAL JOURNAL.

ALASIL

Safe Salicylate Therapy

THE popularity of acetyl salicylic acid is undoubtedly due to the fact that it is one of the safest and most effective non narcotic analgesics available Too often however its use has been discarded by the physician on account of its tendency to irritate the stomach and because entirely pure preparations are not always available

'Alasil' provides the beneficial therapeutic effects of pure acetyl salicylic acid in such a form that it is acceptable even by disordered digestions This tolerability is due to the fact that it combines calcium acetyl salicylate—the least irritating salicylate compound—with 'Alocol' a potent gastric sedative and antacid

Since "Alasil" is better tolerated than acetyl salicylic acid its use can be pushed or prolonged to a much greater extent than the latter 'Alasil' is therefore an analgesic antipyretic and antirheumatic which can be employed with complete confidence in all the many conditions in which such an agent is indicated

SAUNDERS' BOOKS

ALL NEW and of REAL HELP in PRACTICE

BERENS' EYE DISEASES

By 82 of the WORLD'S LEADING AUTHORITIES
Octavo of 1254 pages with 436 illustrations some in colours By 82 International Authorities Edited by CONRAD BERENS M D Ophthalmic Surgeon Pathologist and Director of Research New York Eye and Ear Infirmary Cloth 50s net

Nowhere we believe will you find greater authority on the eye and its diseases than you will get in this *brand new book* Literally it records the experience and the practice of the world's leading authorities on diseases of the eye These contributions Dr Conrad Berens has edited correlated and unified so that this one volume reads smoothly coherently and clearly You will pronounce it as have already those physicians and specialists who have bought it one of the finest works of this century on the eye

SCHUMANN'S OBSTETRICS

By EDWARD A SCHUMANN A B M D F A C S
Professor of Obstetrics University of Pennsylvania
Octavo of 750 pages with 581 illustrations on 497 figures Cloth 27s 6d net.

Dr Schumann wrote this book out of his own large experience During the past 15 years alone he has had under his care over *30 000 obstetric cases* in the home and in the hospital He has presented this practical record with the clarity, the orderliness acquired through many years of exacting teaching You will find the book unusual—unusual in its completeness in its conciseness, in its consideration of modern methods and management You will find it a clear guide to obstetrics as taught and practised to day

CLINICAL HEART DISEASE

By SAMUEL A LEVINE M D F A C P Assistant Professor of Medicine Harvard Medical School
Octavo of 450 pages Cloth 24s net.

A new book that considers every phase in the bedside management of heart disease It gives proved methods of diagnosis, and to day's therapeutic measures for treating each particular condition You will find the actual prescriptions used by the author valuable counsel on diet measures for the relief of pain advice on the conduct of chronic cases and emergencies how to treat heart conditions arising from other diseases This fine new work also includes a chapter of 114 pages on Clinical Electrocardiography with 444 electrocardiograms on 95 figures

RESPIRATORY DISEASES

By 21 AUTHORITIES Eighth Annual Graduate Fortnight of the New York Academy of Medicine
Octavo of 418 pages illustrated Cloth 24s net

The 1935 Graduate Fortnight of the New York Academy of Medicine has devoted its clinical lectures to those Diseases of the Respiratory Tract of most common occurrence in general practice In these lectures twenty-eminent authorities put before the general practitioner the newest diagnostic guides and the latest therapeutic accomplishments—real helps to the busy doctor This is a book of everyday usefulness

BRIGHT'S DISEASE AND ARTERIAL HYPERTENSION

By WILLARD J STONE B Sc M D F A C P
Clinical Professor of Medicine University of Southern California Octavo of 350 pages illustrated Cloth 22s 6d net

The great frequency of Bright's disease and the high mortality rate make this *new book* one of the most important we have published for a long time It is a practical clinical book because Dr Stone wrote it from *bedside notes* which he has been compiling for the past twenty years Each type of Bright's disease is given its full discussion including aetiology symptoms diagnosis and detailed treatment The logical arrangement of the book the orderly presentation of the subject the numerous illustrations combine to form a book to which physicians surgeons and specialists can turn confidently knowing that they will find—*and find quickly*—to day's information on this most important disease

"ALOCOL"

Colloidal Hydroxide of Aluminium

Effective in Nervous Dyspepsia

WHATEVER be the fundamental cause of nervous dyspepsia, it is acknowledged that alleviation of the gastric symptoms is an important part of effective treatment

Nervous dyspepsia connotes hypersecretion This causes flatulence sour stomach discomfort and perhaps pain Alocol provides the ideal gastric sedative since its action is prompt and lasting and entirely free from harmful effects

'Alocol' acts by adsorbing excess of free hydrochloric acid in the stomach forming a colloidal jelly which passes through into the intestines and is finally evacuated Alocol therefore actually removes from the system the causative radicle (Cl) instead of merely temporarily neutralizing it Alocol' does not interfere with normal digestion nor does it determine any unpleasant secondary reactions It is issued in tablet and powder form

Indian Sarasvati playing the Vina (12th Century)

Complete chemical history of Alocol with convincing clinical reports and supply for trial, sent free to physicians on request

Medical Men supervised the Design of the **Linia Belt**

FOR OBESITY, PTOSIS, FAULTY POSTURE POST-OPERATION WEAR

While the Linia Belt was being evolved it was frequently submitted to tests by medical men until with their advice it became the recognised belt for men's wear It is of course made to measure for every case

The Linia Belt is prescribed for obesity because while replacing the ptotic organs it exerts a gentle continuous massaging action helping to disperse adipose tissue and to tone and brace the muscles Its uplifting action its adjustability make it also the belt for various ptotic conditions for post operation wear for wear by the older man for golf riding and other sports

The front is of thin fine non elastic tricot, the back consists of strong elastic, fully adjustable band It is designed to support with an uplifting action

Linia Shorts

for the Younger Man

Designed to give stimulating beneficial support and massage only where needed Linia Shorts are the ideal abdominal wear for the younger man who wishes to guard against the ill effects of sedentary life For every day wear they are practical comfortable convenient For the sportsman they allow of free movement whilst minimising the risk of hernia Linia Shorts are easily washable porous and hygienic

Note firm elastic tension round the abdominal region and the light tension round waist and legs which admits of free circulation

You are invited to examine the Linia Belt and Linia Shorts

We shall be pleased to forward a specimen Linia Belt or Linia Shorts for your inspection free of charge

POST ORDERS can be carried out to your direction on receipt of maximum measurement round girth and required depth from pubis upwards (usual depths 9 10 and 11 inches)

PRICES Linia Belts from 2 Gns to 7 Gns
Linia Short from 25/- to 4 Gns

SPRAY ARGYROL IN COMMON COLD

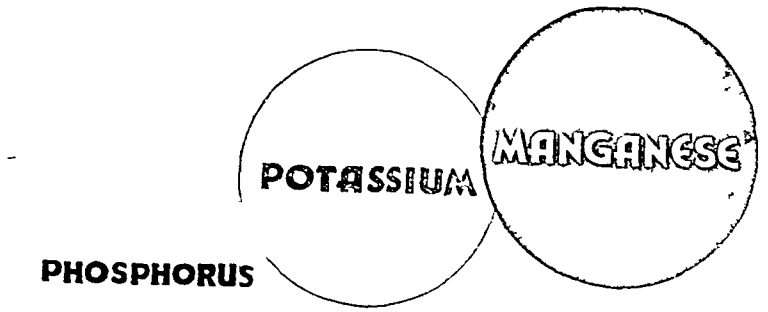
BRAND SILVER VITELLIN

At this time of year, with frequent exposure to cold and wet, the common cold takes on a more serious aspect Tonsillitis, pharyngitis and sinusitis are frequent sequelæ when "dread Winter spreads his latest glooms"

The prevention of complications is the first aim of the physician Early treatment with Argyrol Brand Silver Vitellin not only attacks the infection right at its source, but also quickly relieves the acute distress in the respiratory tract

The Dowling Argyrol pack and the Argyrol spray (20 per cent solution) have become standard therapy throughout the world Rhinologists, following the Dowling technique, find the tampon saturated with 10 20 per cent Argyrol solution, the most effective when used as a local detergent and decongestive for the highly inflamed nasal tissues The new Argyrol Brand Silver Vitellin tablets in small convenient vials are a great convenience in nose and throat practice They not only insure accuracy, purity and genuineness, but also save

time, because a fresh, potent solution is thus made available at a moment's notice, in the doctor's surgery, in the operating room and at the bedside



Argyrol is a unique and original compound, no other silver salt is like it chemically

METATONE

A Palatable Vitamin B Reconstructive Tonic

METATONE is a general tonic particularly suitable for use in the treatment of general debility, during convalescence after influenza and other exhausting diseases, after surgical operations, and during pregnancy and the period of lactation It may confidently be prescribed for its reconstructive, restorative and tonic properties

Metatone is an agreeable fluid combination of vitamin B, nucleinic acid and glycerophosphates, containing in each fluid ounce —

Vitamin B Extract	*10 grains*
Nucleinic Acid	*2 „*
Calcium Glycerophosphate	*4 „*
Potassium Glycerophosphate	*4 „*
Manganese Glycerophosphate	*1/2 grain*
Sodium Glycerophosphate	*2 grains*
Strychnine Glycerophosphate	*1/25 grain*

The adult dose of Metatone is one to two teaspoonfuls, three or four times daily, usually after meals

Supplied in bottles of 8, 16 and 80 fluid ounces

ANAHÆMIN B.D.H.

Further purification of the original Anahæmin B D H reported upon by a group of clinicians acting at the request of the Medical Research Council has been effected According to a recent report (*Lancet*, December 26, 1936, p 1515) the power of this more highly purified product to cause blood regeneration in pernicious anæmia exceeds even that of the original anahæmin the daily injection of such a minute dose as 2 mg constituting effective treatment in many cases

All Anahæmin B D H is now of this improved purity and increased activity

The dosage recommended for the treatment of average cases with this more highly purified product is an initial dose of 2 c c followed by 1 c c at 10 day intervals until the blood count has remained normal for at least a month

Nutritional Anaemia

In women the incidence of anaemia is higher than in men because the physiologic demands for iron during menstruation and pregnancy are not satisfied by a diet which suffices for men Iron must be added

In Ovoferrin, metallic iron is so combined with a protective protein colloid, as to constitute a most efficient and palatable haematinic

Ovoferrin does not irritate the mouth or stain the teeth it does not constipate and is readily taken by children and by gravidae with sensitive stomach and nerves

It stimulates the jaded appetite and often induces intestinal peristalsis In old age Ovoferrin acts as a stimulating general tonic

Brand Colloidal Iron Tonic

The adult dose—a tablespoonful in milk or water, contains one grain of metallic iron in easily assimilable form, for children, the dose is two teaspoonfuls Ovoferrin is prescribed in 11 ounce bottles If you have not used Ovoferrin in your practice we shall be pleased to send you a trial bottle on request

diathermy knife was introduced for removing the breast This was a fundamental change in technique which had its day, and in fact still has its day in certain chosen cases, more especially in advanced or ulcerated cases, when local infection is a special risk

Points in Amputation of Breast

I am not going to describe the technical minutiae of amputation of the breast but I would like to emphasize certain points of importance that are sometimes overlooked

The first is the value of a routine radiological examination, especially of the spine and thorax, in order to eliminate those not very rare cases in which an unsuspected bone metastasis has already established itself During the actual operation I would lay chief stress on the importance of avoiding cooling of the large surface of the wound, and of making sure that one's assistant is not leaning too heavily upon the other side of the thorax It is important, too, that tension on the stitches should be avoided at all costs in order to prevent that aseptic sloughing of the flaps that is one of the most troublesome complications of this operation The only special point in the immediate post-operative treatment is to avoid the painful and trying method of fixing the arm at right angles to the body, which is sometimes employed in the mistaken belief that it will prevent post-operative stiffness Shock and loss of blood are, of course, to be guarded against and to be remedied, either by blood transfusion or by continuous intravenous glucose saline

It is hardly possible to say that any operation can be expected to be entirely free from mortality, but the mortality from amputation of the breast should be, and at the Royal Cancer Hospital is, almost negligible Personally I have been lucky enough to lose only one case and in this case death took place from that still mysterious disaster—pulmonary embolism

Post-operative morbidity also is extremely low Infection of the wound is rare, and the stiffness of the shoulder so greatly feared by the earlier operators is a complication that we never meet with now Indeed, it is amazing to think that so destructive and mutilating an operation should be followed by so little disability The removal of the greater portion of the pectoral muscle and the whole of the pectoralis minor as well, does not appear to prevent quite respectable performances on the golf course or the tennis court, to say nothing of a hard day's work in the house

Results of the Operation

What are the results that we may expect after such an operation as I have described undertaken by an expert operator under ideal conditions in an otherwise healthy woman? We know only too well, for the best statistics, furnished by the best surgeons in the world, show that less than half their patients will be free from any signs of the disease at the end of five years, even when the growth is in its earliest stage apparently confined to the breast itself and where no evidence of invasion of the glands can be detected on the most careful microscopical examination In cases in which the disease is more advanced—where for instance, the axillary glands are palpable on examination and found to be invaded on pathological investigation—the figure drops to something like 20 per cent And when our cases are later still and have reached the stage in which the most casual glance is enough to determine the diagnosis, then the survival rate drops to almost nothing

Do not misunderstand me for there are, of course brilliant exceptions, and quite advanced cases are sometimes operated upon so successfully that the patient come to forget that they have ever been ill But happily the converse of the picture is also true, and the earliest and apparently most favourable cases will sometimes develop recurrence within a few months We surgeons have to live a long time before we have lived long enough to have had the unhappy experience of seeing many of our best efforts and our most favourable cases disappoint us in this grim fashion But we all come to it in time, and we must face the fact that the last few years have not seen any marked improvement, or indeed any improvement at all, worthy of the name, in the results from purely surgical treatment It is natural, therefore, that we should turn to other methods in the hope of some support for our surgical attack

X Rays as an Adjunct to Operation

We have two important agents at our disposal—x rays and radium As in x rays we have an agent which is easily applied, is free—or almost free—from danger is available at a good many centres, the custom has gradually developed of giving patients subjected to surgical operation a course of x-ray therapy as well There is a good deal of controversy as to whether it should be administered before or after the operation, and there is much to be said in support of either method Those who favour prior x-ray treatment point out that the activity of the tumour may be diminished, that sparse scattered outlying cells may be destroyed, and that the danger of cell dissemination during the subsequent operation will be reduced to a minimum Against this is urged first, the delay in operative treatment that in some results from it, secondly, the possibility that the operation may be more difficult and healing more protracted (although personally I think that this objection is without much weight), and, thirdly, that the tumour may be shown by the operation not to be malignant at all

But to my mind the real objection to the use of deep therapy before operation is psychological In all conscience it is sometimes difficult enough to persuade a patient to submit to amputation of her breast it is still more difficult if it is explained that she must first undergo a course of three or four weeks' treatment before the moment for operation arrives My own feeling, therefore, is that if x-ray treatment as an adjunct to surgical operation is carried out at all, it should be done after the operation, and there seems to be no objection to starting it within a very few days of the healing of the wound

There would appear to be good ground for claiming that pre-operative or post-operative deep therapy has already effected some improvement in results, although it is too soon yet to say whether or no an intensive trial of this method is going to make a really great improvement in our ultimate statistics But its application is so rational and so safe in skilled hands, the power and scope of x-ray apparatus is improving so rapidly, and moreover, it is so urgent that something be done to better our results that I hold the view that all our cases of radical amputation should receive it

Radium Therapy

The other great adjunct to surgery is radium, and its use for cancer of the breast Handley again deserves honoured place among the pioneers Long years ago he pointed out that one of the difficulties of surgical operation was the impossibility of following the lymphatic trunks that wind through the upper intercostal spaces to reach the thorax, and he endeavoured to overcome this

is of great assistance, and I subject them either at the time, or later, to an intensive barrage of radium needles

The Value of Radium

I must not leave you with the view that I am a pessimist about the value of radium Indeed, anyone who has worked in cancer for as long as I have can be nothing but an optimist when he compares the composite picture of cancer treatment and its results at the present time with what they were ten years ago The whole aspect of affairs has changed Tongue, mouth, pharynx, uterus, and breast have all shared in the general amelioration, some more than others, some less, and I should emphasize that it is only in so far as the treatment of early breast cancer is concerned (where our hopes were high) that radium has disappointed me But it is only a relative disappointment Radium has furnished us with the most valuable method of special treatment of cancer of the breast at our disposal, and it would be utterly impossible to do without it for our advanced cases, or for those which for any other reason are inoperable

Deep therapy is catching it up, but it has not caught up yet However, my radiological colleagues tell me that the time is coming when they will be able to provide us with an x-ray beam comparable in the shortness of its wavelength with the gamma rays of radium, but delivered with an intensity and in such a quantity as no source of radium supply is ever likely to attain, unless, of course, radium becomes available in almost unthinkable quantities When that time comes, or when *x* rays do become equivalent in power to the gamma rays of radium a new and happier chapter in the history of cancer of the breast will open, and we surgeons once again will have to pause and reconsider our position

Early Diagnosis

You will observe that I have said nothing yet as to the diagnosis of cancer of the breast, and after all, it is the most important preliminary to treatment, whatever that may be I think the most vital point about diagnosis is to remember that it is daily becoming more difficult The influence of propaganda has been so great and so much has been written in the lay and medical press as to the importance of obtaining treatment at the earliest possible moment, that our cases are coming to us at a very much earlier stage than they ever have before The diagnosis of a well-developed cancer of the breast is easy, but the diagnosis of a tiny lump no bigger than a pea is sometimes quite impossible until it has been removed One sometimes hears an argument as to whether there is any danger in cutting into a breast tumour for verification of its nature I believe there is danger, and I think that in those cases increasing as they are in number, in which it is impossible to feel confident as to the nature of a suspicious nodule, it should be completely removed, with a fairly wide margin of healthy tissue round it Then and only then, should it be bisected, when its nature will almost always be at once apparent to the naked eye

It is interesting to note that a special investigation carried out by the Imperial Cancer Research Fund, on the importance of microscopical investigation," showed that the diagnosis of cancer of the breast was less often incorrect than that of cancer in any other part of the body

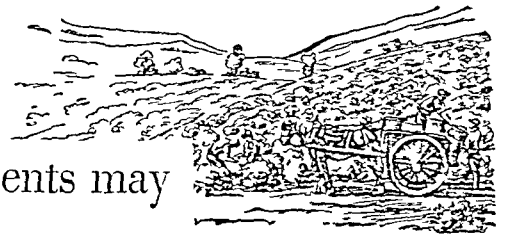
It is obvious I suppose that the removal of these doubtful tumours of the breast should only be undertaken by surgeons who have had that long practical training in laboratory and operating theatre which gives them the ability to recognize the nature of the tumour they are dealing with and the capacity for coping with unexpected situations

Frozen sections are sometimes employed as an aid to diagnosis in the operating theatre, and they are of the utmost value in certain sites But I feel that when an experienced practical surgeon is in doubt about the naked eye appearance of a breast tumour the frozen section is just as likely to be as difficult of interpretation as the gross pathological picture

One other matter that I must not omit Do benign tumours of the breast ever become malignant? I think not, but it is clearly not a question capable of final proof If we see a little tumour to day and tell the patient "I think that is an adenoma, and therefore do not bother about it," and she comes back a year hence with carcinoma, that does not prove that a simple tumour has become malignant, it merely shows that we have been most unwise and have overlooked a carcinoma in its very early stage Who can say with positive certainty that a lump is simple or malignant until it has been removed I cannot, although I can generally venture a pretty shrewd guess, and I am quite often right, but I am also often wrong There can be no excuse for that pernicious practice, the results of which we still sometimes see, of telling a woman not to bother about a lump in the breast unless, or until, it gives trouble When it does give trouble it is trouble indeed

A Working Plan

In conclusion, I should like to feel in a position to give you absolutely emphatic, positive guidance as to what you ought to advise in breast cases that come to your notice, but I do not think that the position is such as especially at the present moment, as to lend itself to emphatic pronouncements I have, however, developed for myself a fairly definite working scheme, based upon a long experience and upon much thought about my own work and observation of that of others



My attitude is that all operable cases of cancer of the breast should be subjected to radical amputation followed by a course of prophylactic high-voltage and short wave length x-ray therapy But, you will say, what constitutes an operable case? And here we are *on* debatable ground Let me first of all tell you of the cases that I regard as *surgically inoperable* I put first those with widespread extension of the growth, or those with secondary nodules, or indeed one nodule outside the breast area or wide ulceration or oedema of the skin, or enlargement of the supraclavicular glands, or the presence of any distant metastasis, or involvement of both breasts, or enlarged fixed glands in the axilla

But there are other factors, too, which render a case inoperable I may call them medical And among these I include pregnancy and lactation, serious intercurrent disease, extreme youth (for example, cancer occurring under the age of 25, as in my experience surgical treatment here is always hopeless), or in such extreme old age that the general expectation of life is less than the average duration of the disease

If we exclude all these, it leaves us with those patients who are not too young nor yet too old, whose tumour is confined to the breast itself and not adherent to the chest walls, in whom the axillary glands have not become grossly enlarged, and where no metastasis can be discovered

Of course old age in itself is not a bar to operation providing the general condition of the patient is satisfactory I operated upon one patient of 82, who survived

How Convalescent Weakly and Anaemic Patients may

TAKE THE GRAPE CURE

—without going abroad—

Many thousands of invalids, in ancient and modern times have been restored to health by what is sometimes called the 'grape cure' the patient stays near a vineyard and lives on nothing but fresh grapes and water. A regime of this kind has, in spite of its merits, the great disadvantage that few sufferers can afford to leave their work and live on a vineyard for a number of months.

This natural Grape Juice Concentrate now brings the vineyard to the home. It consists of nothing but the juice of grapes concentrated by a low temperature process and places the therapeutic power of the living fruit in the hands of every physician. *It contains no alcohol.* The only change which the juice has undergone is the evaporation of most of its water content. Its ferments are still alive and vigorous, its vitamins are unimpaired.

Vita Grape Juice Concentrate contains about 75% of sugar mainly in the form of glucose and laevulose. Consequently it provides an ideal method of administering soluble carbo-hydrates in exceedingly palatable form.

In all cases of fever and cases of heart failure, its use can be invaluable. Nutritional diseases of all kinds are favourably affected, and in view of its high iron content in organic combination, it is a medicine of great benefit to anaemic patients.

Additional information and a sample of Vita Grape Juice will gladly be supplied to any practitioner.

CASE REPORTS

The first case in which I observed its effects was that of a boy suffering *from secondary anaemia following rheumatic fever.* After 14 days on the Grape Juice the change in his colour was striking, and at the end of a further seven days he had regained his natural colour.

The *second case* was that of a married woman suffering from *anaemia secondary to cardiac debility.*

The patient was treated with extract of liver haemoglobin and the usual iron tonic but was making poor progress until she commenced taking the Grape Juice. *After a month* of this treatment her symptoms of pallor, shortness of breath and frontal headaches disappeared and her heart action improved considerably.

GRAPE JUICE

Vita Products Ltd, City Gate House, 39-45 Finsbury Square, London E.C.2

At each subsequent visit the patient was weighed, similar clothing being worn The blood pressure was determined, the urine was examined, and any untoward symptoms were noted

Gain in Weight during a Normal Pregnancy

Our first consideration must of necessity be the average gain during a normal pregnancy During this investigation 211 patients were examined, of these, thirty-seven developed albuminuria and a further fifteen cases had toxaemia although no albuminuria occurred These fifty-two cases cannot be considered when the increase in weight during a normal pregnancy is discussed The average monthly gain in the 159 normal pregnancies was 2 8 pounds during the last three to four months The gain was similar in the seventy-seven primiparae to that of the eighty-two multiparae—namely 2 8 pounds

There are contradictory statements in the literature with regard to comparisons in the gain in weight of primiparae and multiparae Cummings states that in his series primiparae gained 0 1 pound more on the average throughout pregnancy Hannah also finds that there is a slightly greater gain in primiparae during pregnancy Others, however, state that there is no appreciable difference in the increase in weight in first pregnancies as compared with succeeding pregnancies

Although the average increase each month was only 2 8 pounds a number of patients gained considerably more than this during a particular month, one even gaining as much as 12 pounds Owing to this fact it was thought advisable to obtain in every case the *greatest* gain in any one month, in order to ascertain the average for this figure This was found to be 4 8 pounds in the primiparae and 4 4 pounds in the multiparae, the average in the 159 cases being 4 5 pounds

Gain in Weight during a Toxaemic Pregnancy

As stated previously, thirty-seven patients developed albuminuria, due to a mild or severe toxaemia, and a further fifteen had a mild toxaemia although no albuminuria occurred The average weight increase per month of these thirty seven albuminuric cases was 4 4 pounds, that of the eighteen primiparae being 5 pounds and of the nineteen multiparae 4 pounds The average *greatest* increase in any particular month was found to be 8 1 pounds the average in the primiparae being 8 4 pounds, and in the multiparae 7 9 pounds

In the fifteen cases of toxaemia which did not show albuminuria treatment such as diet and rest was instituted when the symptoms and signs were first noticed this may explain the subsequent absence of albuminuria Most of the patients had a raised blood pressure (not less than 140/85 mm Hg) headaches, eye symptoms, nausea, and oedema of the ankles were present in a varying degree The average monthly gain in these fifteen cases was found to be 4 2 pounds, whereas the average *greatest* gain in any one month was 8 pounds

This table shows that the average increase in weight during each of the last three or four months, the period when most toxaemias develop, was almost 2 pounds more in the cases which were eventually toxaemic More striking than this, however, is the sudden abnormal increase in weight in any particular month The cases in which eventually there was toxaemia had gained on the average 8 1 pounds during one month, whereas the corresponding figure in the normal cases was only 4 pounds In other words, the toxaemic cases had gained almost double the normal amount at some time previous to the appearance of the toxaemia

TABLE I

	No of Cases	Average Increase per Month	Average of Greatest Increase in any One Month
Normal cases	159	2 8 lb	4 4 lb
Toxaemic cases (no albumin)	15	4 2 lb	8 0 lb
Toxaemic cases (albuminuria)	37	4 4 lb	8 1 lb

Forty-one cases gained more than 8 pounds during a particular month, and twenty-six of these (63 per cent) became toxaemic at some later date On the other hand 107 cases did not have an abnormal increase—named, above 5 pounds during any month—and among these only one case (0 9 per cent) developed toxaemia Table II illustrates this fact

TABLE II

Greatest Increase in any One Month	No of Cases	No of Toxaemic Cases	No of Normal Cases	Per cent Toxaemic
Over 8 lb	41	26	15	63
Between 6 and 8 lb	36	17	19	47
Between 5 and 6 lb	27	8	19	29
Below 5 lb	107	1	106	0·6
	211	52	159	

If the toxaemic cases in Table II are taken separately it will be seen that fifty-one of the fifty-two cases (98 per cent) had increased over 5 pounds in weight during one of the later months of their pregnancy, 50 per cent gaining over 8 pounds, 32 6 per cent between 6 and 8 pounds, 15 per cent between 5 and 6 pounds and only 1 9 per cent below 5 pounds It should also be pointed out, however, that fifty-three (33 per cent) of the 159 cases in whom no toxaemia ensued had an increase of over 5 pounds during a particular month Therefore an abnormal increase in weight does not invariably signify that the patient will develop a toxaemia

Abnormal Increase in Weight as an Early Sign of Toxaemia

We must now consider at what time in relation to the toxaemia, this sudden increase in weight appears In thirty-seven patients who developed albuminuria thirty-five showed an abnormal gain in weight, 5 pounds or more per month, before albumin appeared One of the remaining two cases had albuminuria on the same day as the abnormal increase in weight was noted, and the other was the only case in which no abnormal gain was found The albuminuria did not appear immediately in the thirty-five cases, but was found on the average two nine days later, the longest period being ten weeks and the shortest five days

Rise of blood pressure is known to be an earlier sign than albuminuria in a toxaemia of pregnancy, it would therefore be of interest to consider when this sign appeared in relation to the abnormal gain in weight Seven of the thirty-seven patients had a raised blood pressure before the abnormal weight increase was detected, and in a further three cases the rise in blood pressure seemed to coincide with the increased gain In the remainder, if the blood pressure rose, it did so after the abnormal gain was shown In the fifteen cases in which no albuminuria occurred one patient had a rise in blood pressure one month before any abnormal increase in weight was detected An increased gain and a rise

'PANOPEPTON'

WHAT IT CONTAINS

Contains in stable agreeable solution 24 per cent of solids, derived by physiological hydrolysis from prime lean beef and whole wheat in a scientifically balanced ratio

Contains all that is digestible in beef—in its juice and in its muscle tissues

Contains all that is digestible in wheat—its proteins, its carbohydrates

Contains all the savory and stimulating elements, the extractives, the mineral constituents of beef and wheat

Contains the principle of nutritional therapy of anaemia which is known to be developed under the physiological contact of gastric tissue juice and beef muscle

Contains these constituents in the soluble, perfectly diffusible form into which they are converted in the process of normal digestion

USES OF 'PANOPEPTON'

Can be relied upon in cases where the nutrition of the patient is of prime importance

Has saved the patient in desperate straits due to intolerance of food

Has nourished and restored in cases of intolerance of other foods

Suggests itself as an accessory supplemental food in the nutritional therapy of anaemia

Possesses remarkably restorative and stimulating properties

Is most nutritious, most agreeable as a food at night against insomnia-exhaustion due to acute need of nourishment

Is most agreeable when taken cold—requires no preparation—is instantly available in a crisis

Supplied in 12-oz bottles

A sample will be sent to Members of the Medical Profession post free on request

The majority of the toxaemias (82 per cent in this series) would, in the present state of our knowledge, be diagnosed at the earliest possible time if the weight only was taken regularly This is quite a simple procedure which the patient can perform herself, provided that similar clothes are worn and the same reliable scales are used on each occasion If an increase of more than 5 pounds occurs she should have had instructions to report to the doctor In this way a certain number of the toxaemic cases may be avoided, if not avoided, with appropriate and early treatment most of the cases would be less severe Appropriate treatment infers that the patient should be seen frequently in order that the blood pressure be estimated other signs and symptoms of toxaemia looked for, and a diet given until the abnormal increase in weight has been reduced An important dietetic measure appears to be the elimination of salt, in a few cases this alone was sufficient to reduce the weight

Conclusions

1 The average increase in weight during pregnancy is 16 to 18 pounds, and the monthly gain during the second and third trimesters is normally between 2 and 4 pounds

2 An increase of 5 pounds or more per month is suggestive of an impending toxaemia, the probability of its occurrence varying directly with the amount of the sudden increase

3 Every patient should weigh regularly throughout pregnancy, and be instructed to consult her doctor if the monthly gain is 5 pounds or more

Summary

1 The variations in weight of 211 patients, fifty-two of whom developed toxaemia, have been investigated and analysed

2 The average gain of the toxaemic patients was found to be definitely more than that of the normal patients Moreover, a sudden abnormal increase in weight was of great value in foretelling a toxaemia, 63 per cent of the cases which gained more than 8 pounds in one month became toxaemic, whereas the incidence of toxaemia in those cases with a normal monthly gain was only 0 9 per cent

3 If a patient gained more than 5 pounds in a particular month it did not invariably signify that a toxaemia would develop, but 98 per cent of the toxaemic cases showed this abnormal gain

4 This abnormal increase in weight appeared, on the average one month before the albuminuria, and was as a rule an earlier sign than a raised blood pressure

5 The type and duration of labour did not appear to be affected by increased weight of the mother Loss of weight a few days before labour was noted in only 36 per cent of the cases

6 It was concluded that systematic weighing of patients during the antenatal period is of definite value in foretelling and perhaps avoiding, the toxaemias of pregnancy

LUPUS VULGARIS*

WITH SPECIAL REFERENCE TO ITS TREATMENT WITH THE FINSEN-LOMHOLT LAMP

BY

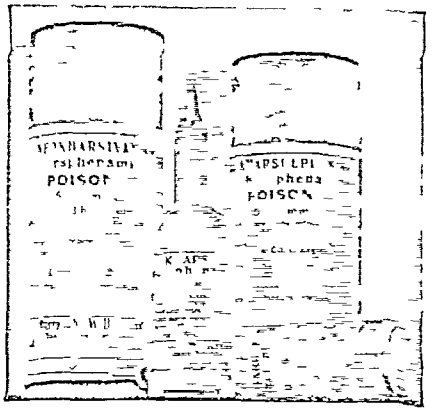
ROBERT AITKEN, M.D., F R C P Ed

Physician to the Skin Department, Royal Infirmary Edinburgh

Lupus vulgaris, though not a common disease, constitute a serious social and economic disability Sufferers from this disease are apt to be shunned by their fellow beings while if the disease is extensive there is difficulty in obtaining employment As a result the patient is dependent for maintenance on the public authorities, or on his family with possible hardship to them.

Lupus patients also suffer considerable hardship even in connexion with holidays If the disease is at all extensive they get admission to hotels and boarding houses with difficulty, and if they take private rooms they are looked at askance and it is made clear that they are not really welcome Because of this these patients not infrequently prefer to remain at home They have therefore not the same chance of getting their health built up, and so the disease tends to spread more rapidly

Incidence



In Scotland lupus is not a common disease I am indebted to dermatological colleagues in other towns for furnishing me with statistics relating to the incidence of lupus as they see it in their clinics In Glasgow during the last few years the number of lupus cases has varied from 0 3 to 2 1 per cent of all new cases of skin disease In Dundee the number has been 0 4 per cent in Aberdeen 0 78 per cent In the Royal Infirmary of Edinburgh the incidence has varied from 0 6 to 1 per cent in the last five years, the number of new cases of skin disease being about four thousand per annum The incidence of lupus as seen in Edinburgh is definitely less than it was ten to fifteen years ago, when the percentage varied from 2 8 to 4 The tendency to decrease is seen in other Scottish towns also The reason for this decrease I shall discuss later The percentage of lupus cases seen in some clinics in England is about the same as it is in Scotland though other clinics have about double our percentage The disease shows the same tendency to diminish and I have little doubt that the same causes responsible for the decrease are found in England as in Scotland

Sex Incidence—Lupus vulgaris is more common in females than in males, the incidence being twice to three times as great in women as in men This greater incidence among women is not limited to this country, but is seen fairly constantly throughout the world

Age Incidence—Lupus usually begins in childhood or early adolescence Cases are seen where the disease begins after middle life, but these are not common In an analysis of 294 cases in the Royal Infirmary I found that the age period 6 to 10 years shows the greatest number—no fewer than seventy three cases, or almost 25 per cent, occurring during that time Before the age of 5 years forty-five cases occurred, and of these a good many began during the first year of life, several beginning about eight months and generally after some illness such as measles The age period 10 to 15 years accounts for fifty cases Thus we see that more than half the cases begin during the school life of the child

AA and AO are indistinguishable by direct laboratory tests, so that we have only four actual blood groups or phenotypes The reason for this is that blood of group A will be produced equally well in an individual whether he has one or two genes for A in his chromosomes

Genotype	Phenotype (Group)
AB	AB
AA AO	A
BB BO	B
OO	O

Bearing in mind that when the male and female germ cells unite to form a new individual the cells of the latter contain one half-set of chromosomes, and therefore of genes, from each parent, we can forecast the manner in which the blood groups will be inherited Thus a male of group AB will produce germ cells half of which will carry the gene for A and half the gene for B, similarly a female of the same group will produce germ cells containing A or B The offspring of these two parents may be of genotype AA, BB, or AB, depending on which of the possible combinations of the parent genes takes place This is governed solely by chance, so that if we take a number of matings of AB with AB we would expect the offspring to be 25 per cent group A, 25 per cent group B, and 50 per cent group AB (see figure)

Reasoning in a like manner, matings of AB with O parents would be expected to produce on the average 50 per cent of group A and 50 per cent of group B progeny When we come to parents of group A we must allow for the two genetic forms AA and AO, the former gives rise to germ cells all containing the gene for A, while the latter produces cells half of which contain the gene for A and half that for O Similarly with group B individuals For example, the mating of a heterozygous A (genotype AO) with a heterozygous B (genotype BO) can give rise to progeny of genotypes AB, AO, BO, and OO—that is to children of all four groups

The foregoing facts concerning the mechanism of inheritance of the agglutinogens A and B can be resolved into two laws

1 The agglutinogens A and B cannot appear in the blood of a child unless present in the blood of one or both parents

2 A group O parent cannot have a group AB child and an AB parent cannot have an O child

The following list gives the children possible and children impossible from the matings of the various groups

Parents	Children Possible	Children Impossible
AB × AB	AB A, B	O
AB × A	AB A B	O
AB × B	AB A B	O
AB × O	A B	AB O
A × A	A O	AB B
A × B	AB A B O	—
A × O	A O	AB B
B × B	B O	AB A
B × O	B O	AB A
O × O	O	AB A B

The Agglutinogens M and N

In 1928 Landsteiner and Levine described in human blood corpuscles two new agglutinogens M and N, which define three types of blood—namely, type M, type N, and type MN These agglutinogens, demonstrated by means of immune rabbit sera, were found to occur independently of the agglutinogens A and B The agglutinogens M and N were shown to be inherited as Mendelian dominants dependent on a single pair of genes M and N, there being only three possible genotypes MM, NN, and MN, corresponding to the three phenotypes M, N, and MN In no instance has a blood been found to lack both M and N agglutinogens The mechanism of the inheritance of the M and N types is as follows

Parents	Children Possible	Children Impossible
M × M	M	MN N
M × MN	M MN	N
M × N	MN	M N
MN × MN	M MN N	—
MN × N	MN N	M
N × N	N	MN M

This resolves into two laws

1 The agglutinogens M and N cannot appear in the blood of a child unless present in the blood of one or both parents

2 A type M parent cannot have a type N child and an N parent cannot have an M child

These theories of the inheritance of the agglutinogens A, B, M, and N have been amply confirmed by study of their distribution in large numbers of families in various countries and by statistical tests concerning the incidence in numerous populations

Establishing Non-paternity

Since the agglutinogens A, B, M, and N are inherited in accordance with the above laws, blood group tests are applicable to medico-legal problems concerning disputed blood relationship, of which the commonest is [illegible] accusation of paternity Let us take an example A woman accuses a certain man of being the father of her illegitimate child and the paternity is denied The blood groups of the child, mother, and man are found to be A, O, and O, respectively The child thus possesses the agglutinogen A, not present in the blood of the mother so that the true father must have belonged to group A or A As this agglutinogen is not present in the blood of the accused man his non-paternity is established As however, that the accused man had been of group O All that could be said in that case would be that he might be the father, not that he is the father since another man of either group A or AB might be the father Having thus failed to reach a definite decision with the A and B tests, the M and N types of the mother, and child can be determined If these show an impossible combination the man is exonerated

BRITISH MEDICAL JOURNAL

LONDON SATURDAY JANUARY 23 1937

CANCER OF THE BREAST *

BY

CECIL ROWNTREE, F R C S

Senior Surgeon Royal Cancer Hospital London

It is natural that those of us who spend a large part of our lives in the Royal Cancer Hospital should regard cancer of the breast as a very common disease and so it is within the walls of that hospital, as will be appreciated when I say that about one hundred cases come for treatment every year

But of course we cast our net wide and in order to get a true picture of the real frequency of the disease it is necessary to think statistically for a moment and to remember that while there are over 33,500 doctors in England there would appear to be not more than 6,500 fresh cases of cancer of the breast each year Equally divided among us all this number gives only a fifth of a case apiece It follows, therefore that cancer of the breast is not really common enough to enable many of us to have enough personal experience to assess the value of different methods of treatment We are all apt to be unduly influenced by one case—often the last one seen—and all sorts of fallacies result One practitioner who has recently had one or two good results following upon operative treatment may think it is all that can be desired while another man in the next street having recently seen a case of recurrence thinks all treatment useless and the disease hardly worth treating

As is usual in so many other problems the truth lies somewhere in between and I want to show both sides of the picture On the one hand we see grounds for the greatest optimism and on the other bitter disappointments and heart-breaking failures But in spite of these variations cancer of the breast is a disease which in the aggregate does notably maintain a very steady average picture

Some Figures

Let me give you some figures Consider, for instance cases of cancer of the breast in which no active surgical or radiological treatment has been employed Of course we cannot get such figures now as all cases are treated by one or other of these methods but there are plenty of statistics worked out by an earlier generation and they show that on the average a woman with cancer of the breast lived three and a half years when no treatment of any kind was carried out

This is a very important figure for it is upon this datum line that the average success or otherwise of any method of treatment must be judged And what do we find? The statistics so carefully collated and analysed by the Ministry of Health show that operative treatment even at its very worst (for its figures only relate to patients that died of recurrence after operation) adds three years to this average so that women with cancer of the breast who come for surgical treatment may expect to live an average of six and a half years from the first onset of the disease This is the worst What is the best that can be expected?

History of Surgical Treatment

But before discussing after results let me recall the history of the surgical treatment of breast cancer It is a long story in point of time for it goes back to the dim ages at the dawn of surgical history when the cancerous breast was excised by the crude methods then available And for century after century the same primitive local excision continued to be practised until the coming of Lister put surgery on a different basis Surgeons were no longer compelled to make their operations as simple as possible owing to the certainty of infection of the wound they were now able to plan their incisions fashion their flaps, dissect out the muscles and indeed fit their operations to meet the conditions imposed by the disease Pathological anatomy began to play its part in dictating an operative scheme and surgeons ceased to be artisans and became pathologists as well

In 1894 Halsted gave us what is to all intents and purposes the modern operation for amputation of the breast His operation was based on the pathological anatomy of the cancerous breast and its extensions and upon observation of the most usual sites for secondary nodules and recurrences It at once put the outlook for these cases on a different footing but in spite of great improvement in results critical study of the after history of the cases revealed a disappointing percentage of failures

The next great step forward was Sampson Handley's enunciation of the principle of lymphatic permeation and the planning of various modifications of the Halsted operation with a view to meeting the situation indicated by his theory Very briefly the salient points were a less wide removal of the skin (which was a great blessing both to the patient and to the surgeon) and a much wider removal of the deep fascia in which the vulnerable lymphatics lay Although there are many who do not accept Handley's views in their entirety yet one notices that it is Handley's operation that is the standard technique employed in every clinic in the surgically civilized world and this operation may be said to represent the zenith of the purely surgical treatment of cancer of the breast

It has often been said of the breast as of other organs that operative treatment has reached its limit Although it is true that a limit has probably been reached as to the amount of tissue removed (for some surgeons say they remove everything but the bones) yet as to the method of its removal who can say what the future may have in store for us? We had an indication of the sort of development that may take place when the use of the

* A lecture delivered at the annual meeting of the Oxford Medical Society on November 13th 1936

supplying the rectum, cervix, and the base of the bladder In all the mammals with a bicornuate uterus the broad ligaments contain an anastomosis not only of the ovarian, uterine, vaginal, and lateral sacral arteries, but also of the branches of the external iliac artery in the neighbourhood of the internal abdominal ring The latter branches, in the pregnant rabbit, cat, or dog, are as large as the uterine and ovarian arteries In the woman these uterine branches of the external iliac arteries have been almost entirely suppressed They persist as small branches to the round ligament of the groin, but they are significant In the human genus also the ventral extension of the genital

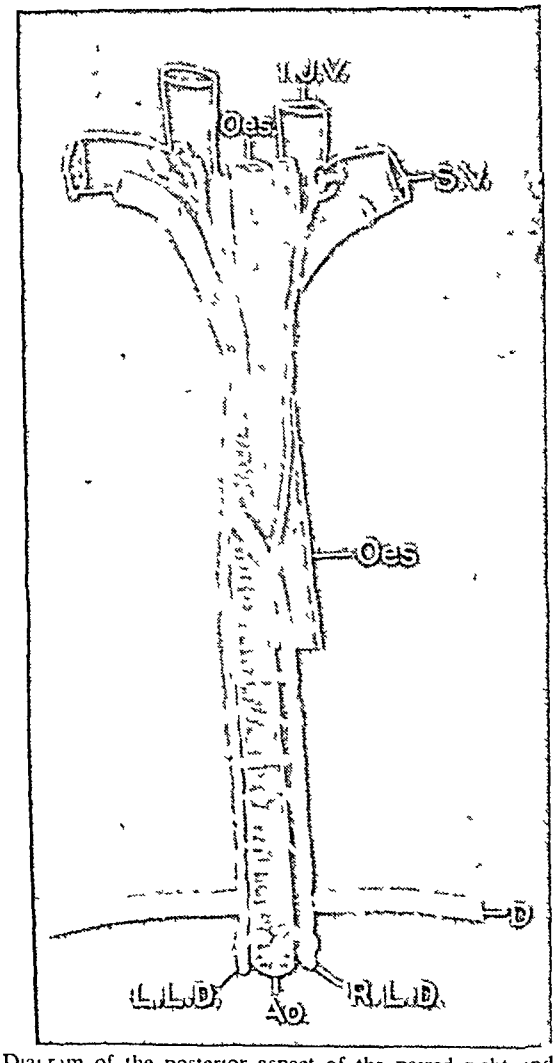

Diagram of the posterior aspect of the paired right and left lymphatic ducts in the human embryo of the third month to show the manner in which the adult thoracic duct is formed from the right duct inferiorly one of the numerous transverse anastomoses and the left duct superiorly in accord with the left sided aortic arch The superior portion of the right side persists as the right lymphatic duct of the adult Abbreviations Oes = Oesophagus IJV = Internal jugular vein SV = Subclavian vein D = Diaphragm Ao = Aorta LLD = Left lymphatic duct RLD = Right lymphatic duct

cleft accounts for the relatively large supply to the pudendum from the superficial and deep external pudendal branches of the femoral artery

As in the case of the upper and the lower limbs, the lymphatic drainage of the female genital tract is clearly portrayed by this brief history of the mammalian arterial pattern The glands involved in carcinoma of the cervix are essentially internal iliac common iliac, aortic by reason of the uterine artery aortic direct by reason of the anastomosis between the uterine and ovarian arteries, superficial and deep inguinal glands by reason of the round ligament and the large ancestral uterine branches of the external iliac arteries, internal iliac, common iliac, and aortic by reason of the internal pudendal arteries, presacral glands by reason of the lateral and middle sacral arteries, and superficial inguinal by reason of the superficial and deep external pudendal arteries from the femoral

It is probable that an attempt at a block dissection of any of these groups of glands is doomed to failure, whether it be for carcinoma of the cervix, the ovary, or the vulva Primary healing of the skin of the groin after a block dissection of the inguinal glands is rarely, if ever, seen This has its counterpart in the chronic infection of the inguinal area in the male affected by buboes The skin of the groin will stand nothing more than a linear incision if healing by primary intention is to be guaranteed

Age Changes in the Lymphatic System

The precocious development of the lymphatic ducts and valves in the early embryo is purchased at a price The senile degenerations of the lymphatic vessels probably precede those of the arterial and venous systems, so that the effective extent of the lymphatic vessels undergoes considerable shrinkage with age It is not without significance that age changes in the way of degenerations with or without calcification of the matrix, constitute a phenomenon commonly witnessed in the ligament arteries and meninges of the brain and spinal cord in the aged dissecting-room cadaver The slow rate of lymphatic involvement in post-menopausal cancer of the breast or female genital tract may be a consequence of the senile shrinkage of the lymphatic vessels draining the areas

J P Bose and U N De (*Indian J med Research* October, 1936 p 489) have estimated by the method of Myers and Wardell the total plasma cholesterol content in one hundred normal and eighty diabetic Indians together with the blood sugar in the diabetics The normal plasma cholesterol values ranged from 102 to 178 mg per 100 c cm, 91 per cent lying between 120 and 160 which was taken as the normal range, the mean value was 147 mg per 100 c cm There was no difference between males and females In the diabetics the plasma cholesterol ranged from 100 to 410 mg per 100 c cm, and bore no relation to the degree of hyperglycaemia The cases were grouped according to their plasma cholesterol contents and observed for ten days with treatment appropriate to their clinical needs Twenty-four cases had a normal plasma cholesterol content, showed few complications, and responded satisfactorily to treatment In the other groups with hypercholesterolaemia as the range of plasma cholesterol content rose, the frequency of complications especially arteriosclerosis rose, and the response to treatment was less and less satisfactory The authors conclude that the degree of cholesterolaemia in diabetes is a more satisfactory index of the severity of the disease than is any other factor including hyperglycaemia They discuss the relation of hypercholesterolaemia to arteriosclerosis in diabetics

coming of the radical operation by implanting tubes of radium into the vulnerable intercostal spaces

Then we pass to another stage Reginud's work in establishing the value of the long continued application of small quantities of radium widely scattered through the affected area, gave a new impetus to the treatment of cancer of the breast by radium therapy A large number of advanced cases unsuitable for surgical operation were subjected to this new form of treatment The results in many cases were dramatic—so dramatic that it was apparent that a new method had evolved which was likely to have far-reaching consequences And so it had, for within a comparatively short time Keynes at St Bartholomew's Hospital began to undertake the treatment of early operable cases of cancer of the breast by interstitial radium And Keynes was soon followed by a good many other surgeons who felt sufficient dissatisfaction with purely operative methods to lead them to embark upon this new experiment It was a venture for which there was much support to be found not only in the results obtained in such sites as the lip tongue and cervix uteri but also in the highly satisfactory—though only temporary—benefits resulting from the radium treatment of even the most advanced cases of cancer of the breast The accessibility of the breast, its ease of observation, and the large number of cases available for comparison, coupled with the extreme willingness of the patients to submit to this new form of treatment all combined to give a powerful impetus to the method This resulted in a large number of cases being dealt with on these lines in London, New York, and other great centres We naturally played our part at the Royal Cancer Hospital in seeking opportunities for a test of what we may call the radical radium treatment of early cases

Radical Radium Treatment of Early Cases

Very briefly, the technique employed consisted in the implantation of radium needles of various lengths in such a way as completely to penetrate and surround the primary focus and the areas of probable lymphatic spread At the Royal Cancer Hospital we used platinum needles containing radium salt In New York they rather specialized in radon contained in gold capillary tubes, which have the great advantage that they can be obtained in almost unlimited quantity and in sections of great length

These are all matters of detail and of no fundamental importance providing the quantity of radium or radon is sufficient the duration of dosage long enough, and the placing and distribution suitably planned to meet the circumstances of the case

What are the results to date? It is early days to give carefully analysed figures of the ultimate or even interim rate of our patients, for this is a matter of years But it is fair to say that on the whole the results support the view that this method of treatment does give results which are at least comparable with those obtained by operative treatment But statistics alone, until they become so overwhelming in quantity and quality as to prove a point beyond all discussion are not always sufficient by themselves to determine current practice And it becomes pretty clear what the general feeling of most of the surgeons at the Royal Cancer Hospital is when I tell you that the proportion of radical amputations carried out there has increased in the last year or so The pendulum is swinging back, or has swung back to the operative treatment of early cases

Of course, as in all experiments that show some measure of success, one tends to be too optimistic and I think now that we were all perhaps a little too hopeful that a method had been achieved which would do as much or more for our patients than operative treatment and would at the same time spare them the distress and mutilation of amputation

Difficulties of Radical Radium Therapy

Radical radium treatment did not prove quite as simple as we had hoped In the first place, the amount of work involved in recording sketching and following up the cases enormously added to the clerical work of the hospital, and of course to the expense We were faced with the constant difficulties occasioned by stupidity on the part of patients who could not or would not understand the necessity for a careful follow up and perhaps the need for further treatment But above all, we were faced with new conditions not hitherto experienced extensive radium burns and their explanation and treatment and in particular the difficulty caused by the fact that some of the tumour masses failed to resolve in spite of intensive treatment And what, then was to be done with them? Further long exposures and the possibility of really serious burns? Or surgical removal and invalidation of the whole experiment? Some of the masses were removed, of course and found to contain living cancer cells But the fate of similar masses that had not been removed served strongly to suggest that the cancer cells in question had been reduced to a condition of inactivity although no man could say how long such inactivity might be expected to persist

Some of these difficulties are of a nature that time increased facilities, better team work and a clearer comprehension of their origin will in due course adjust for us But some of them are fundamental to the method and I see no way of getting over them I have some doubt as to whether any successful plan of campaign of this sort will ever be evolved which will give us what we scarcely have the right to ask of any method For we expect our method to deal with a disease of which the nature is unknown, its precise method of extension only suspected and its growing edge an indeterminate nebulous zone which in one case may be confined to the breast and in the next (to all appearances quite identical) may already have extended within the chest itself It is difficult to imagine any possible distribution of radium which will overcome these obstacles My view therefore is that in the present state of our knowledge all early and favourable cases should be subjected to radical operation

But what are we to do if during the course of an operation for what looks like an early favourable case we discover that the disease is more extensive than anticipated and the glands obviously and grossly invaded up to the apex of the axilla? In these cases I always remember that I am faced with the possibility not only of failing to do good but of really *doing harm* What surgeon is there who cannot recall instances when a radical operation in an advanced case of this kind has been followed by widespread local dissemination extensive cancerous infiltration of the skin and subcutaneous tissues and early onset of that most distressing complication of all—the mammoth arm? Accordingly when I am faced with this situation (and this is where I perhaps differ from some of my surgical colleagues) I am tempted to remove only the grosser part of the disease leaving a respectable margin of healthy tissue to cover over what I have had perforce to leave behind in the hope that other treatment may succeed in doing what I have failed to do with the knife In such cases I believe that radium

Reviews

ASSESSMENT OF DISABILITY

Disability Evaluation Principles of Treatment of Compensable Injuries By Earl D McBride, B S, M D, F A C S (Pp 623, 374 figures 38s net) Philadelphia and London J B Lippincott Company 1936

Dr Earl D McBride of the University of Oklahoma asserts that "the profession is making no effort to develop a scientific basis for interpreting or appraising the end-results of injury in mathematical or monetary values

As he [the doctor] has never done hard manual work he is incompetent to testify from experience as to the ability of an injured labourer to perform his duties Furthermore, the average physician is not accustomed to be definite In his practice he deals constantly with uncertainties" It cannot be claimed that this book provides a reliable table of figures from which the compensation value of any particular injury can at once be ascertained—indeed, by the nature of the human material no such precision is possible, one cannot assess the earning capacity of a man by direct measurement or simple arithmetic Nevertheless it is very necessary to attempt, as is here done, to apply rational principles and make some approach to uniformity of practice in arriving at such assessments, so as to eliminate as many as possible of the factors making for uncertainty One cannot measure fear or loss of confidence, but one can and should measure muscular wasting, deformity, and restriction of movement

Perhaps the most valuable feature of this book is the analysis of the functions of the body, considered as a machine designed to carry out certain mechanical activities The actions of muscles and joints are described in great detail and with a wealth of good diagrams, and the impairment of function which may result from injury is aptly illustrated by sketches of workmen actually using the tools of their trade It is recognized that physical handicaps may be more or less successfully overcome, and sections on "Compensatory Possibilities" explain how this may be done in many cases

The author is sceptical as to the value of physiotherapy for stiff joints, this subject being dismissed in a few lines with the observation (which will be widely endorsed) that "voluntary effort and active motion and exercise is the chief stimulant to repair and restoration of motion" Massage and other such measures are indeed useful mainly in so far as they help the patient to do things for himself References to other authorities are rather meagre throughout the book and it will come as a surprise to the English reader to find in the section devoted to a consideration of fractures (over two hundred pages in all) only one reference—and that a rather disparaging one—to the work of L Bohler

The principles of treatment of fractures are well set out but there is no mention of the proper organization of fracture clinics without which in the opinion of the B M A Fracture Committee the results of treatment can hardly be much improved Very little is said about the importance of re-education and vocational training of the physically handicapped—a subject which has received much attention in America and is beginning to interest those most concerned in this country There is a well-written chapter entitled The Industrial Back in which nearly five pages are taken up with an account of how an examination of the back ought to be carried out, and a useful table shows the differential diagnosis of pain in the back With regard to treatment it is remarked that "haphazard mechanical measures and half-hearted medicinal procedures often accomplish very little or no improvement, and create discouragement and economic loss" The victim of an injury to the back often has hardly any examination, and no more treatment than an occasional prescription for bromides and liniment

In discussing the psychological factors in disability the author passes so readily from neurosis to fraud and back again that one suspects that he hardly distinguishes one from the other After giving the admirable (and necessary) advice that "the individual examined should be shown all the tact and courtesy ordinarily extended to a private patient Confidence otherwise will be broken, so that questions and tests will be undependable," Dr McBride goes on to say that the question of whether a complaint of pain is genuine or not may be settled by giving a "dose of sodium salicylate or aspirin by rectum, sufficiently large to be certain to produce insensibility to pain Put through appropriate tests and note voluntary effort to show evidence of pain" One wonders whether the author really practises these "third degree" methods on his private patients, and if so what results of any value are so obtained It seems hardly to have occurred to him that anxiety neurosis may exist as a clinical entity, much less as a seriously disabling disease, comparable in this respect to a chronic infection, and often requiring careful and prolonged treatment There is an obvious slip on page 569 where it is stated that injury to the seventh cranial nerve may result in loss of hearing

The book is excellently printed and illustrated, and should prove a valuable work of reference to industrial medical officers and others who may be called upon to advise as to claims for compensation for personal injury

X-RAY INTERPRETATION

Roentgen Interpretation A Manual for Students and Practitioners By George W Holmes M D and Howard E Ruggles M D Fifth edition thoroughly revised (Pp 356, 243 figures 22s 6d net) London H Kimpton 1936

This book is a brief survey of the field of x-ray diagnosis, covering the essentials of the subject and giving at the end of each chapter an extensive bibliography, which forms a good and useful guide to the student who wants more detailed information The authors stress the need for constant collaboration with other branches of medicine and surgery if the full value of the x-ray examination is to be attained

The first six chapters describe all the common lesions of bones and joints, and in addition deal with the general rules which form the basis of successful x-ray interpretation The mistakes which are sometimes made on account of defective films and artefacts are pointed out, as are also anatomical variations and congenital abnormalities A useful table of the appearances of the centres of ossification and the time of their fusion is given All the common fractures and common diseases of bone are well described and illustrated by clear radiographs An excellent chapter deals with the lungs the diaphragm the heart, and great vessels The illustrations here are carefully chosen and of high quality A brief survey of the gastro-intestinal tract and of the genito urinary tract describes the normal and abnormal appearances met with The final chapter describes fluoroscopic technique and the dangers to patients and operators from electrical discharges and over-exposure

Although this book only gives a brief survey it is the outcome of many years practical experience, and is an

ten years Nor is the mere size of the primary growth of first importance, as long as the extension is outward as it were and not inward towards the chest wall

So far the indications are clear and our course is easy But what are we to do for patients not suitable for radical operation? We will consider first those whose unsuitability derives from general causes, and not from the condition of the local disease—the very young the very old the very feeble the diabetic, those with very high blood pressure, and, of course, those who absolutely refuse operative treatment Here, too, I think our course is clear Interstitial radium treatment carried out on a comprehensive scale unquestionably offers these patients their best chance of long survival

Then we come to the cases where radical operation is unsuitable owing to the extent of the primary disease or to gross involvement of the axilla or even slight involvement of the supraclavicular glands Here I believe the best course to be a strictly limited operative removal of the tumour and surrounding breast tissue followed by implantation of radium needles in the axilla and the usual lymphatic paths One cannot but feel that by removing the major portion of the disease one has put the patient's tissues in a better position to take advantage of the effects of the subsequent radiation therapy This limited amputation has also proved of great value in my hands in cases where ulceration of the tumour is imminent, or has already become established

Lastly, we come to the class in which the local condition is more widespread, and where skin nodules, peau d'orange diffuse invasion of the breast or involvement of both organs is manifest In these again, our course is quite clear They are naturally quite unsuitable for surgery and the disease is too extensive for the rather limited powers of radium—I mean of course limited in the geographical sense Deep therapy is the method of choice in such cases as these with the proviso that the voltage should be as high as possible and the beam should be delivered with all the intensity that the tissues will stand

It sounds somewhat paradoxical but it seems to me that it is in some of the most widespread and therefore by ordinary standards our most hopeless cases that the most brilliant results of x ray therapy have been obtained Their lives are not saved but they are prolonged in a high degree of comfort for very long periods It is certain that my x ray colleagues have taught me that we must never accept final defeat in these cases of advanced breast cancer until visceral metastases afford unmistakable evidence that the end is near

---

The Northcote Trust which deals largely with the social supervision of the patients at St Thomas's Hospital has completed its twenty seventh year of work and its last report covers the twelve months ended October 1936 It records a real improvement in housing conditions and unemployment and illustrates the work which the almoners undertake Help is forthcoming in necessitous cases in ways such as the obtaining of employment, the provision of convalescence treatment the after care of cancer cases and nursing at home The Northcote Trust Hostel for Girls has been rebuilt and since its reopening last August has had a full complement of girls and infants Patients visited at home during the twelve months under review numbered 333 898 were assisted in other way than by the provision of convalescence facilities or surgical appliances 993 received convalescent treatment and 787 surgical instruments were supplied The income of the Trust during the year was £2,810, and there was a small credit balance at its close

VARIATIONS OF WEIGHT DURING PREGNANCY*

BY

M D ARWYN EVANS, M D, F R C S Ed

First Assistant to the Professor of Obstetrics and Gynaecology Welsh National School of Medicine Honorary Assistant Gynaecologist to Cardiff Royal Infirmary

The importance of weight taking during pregnancy and the significance of an abnormal increase has attracted very little attention in this country

In 1862 Gassner showed that there was a progressive increase in weight of the mother which was greater than that due to the foetus and the hypertrophied reproductive organs He found that during the last three months of pregnancy there was an average increase of 3 5 to 5 5 pounds Zangemeister (1916) advocated weight taking as a means of detecting incipient toxaemia and in 1925 he showed that during the few days immediately preceding labour there was a definite loss in weight Hirsch (1922) demonstrated a loss of weight a few days before labour and ascribed this decrease to the activity of the hypophysis

Davis (1923) found that the usual gain during pregnancy was 20 pounds He came to the conclusion that weight taking should be a routine practice in ante natal work since it gave information about latent dropsy In the same year Hannah found an average gain of 12 pounds during pregnancy Wieloch (1924) stated that the tendency towards insidious oedema could be detected by systematic weighing of the patient Randall (1925) found that the average gain in primiparae was 23 2 pounds and in multiparae 21 pounds He concluded that the extent of the increase in weight should aid materially in foretelling the toxaemias of later pregnancy

Slemons and Fagan (1927) found the average gain to be 16 5 pounds Toombs (1931) made comparisons between the mother's gain during pregnancy and the infant's weight but failed to establish any relation Bingham (1932) stated that abnormal weight increase was a precursor of toxaemia and that it also tended to make the labour more difficult owing to the deposit of fat in the pelvis He found that the child tended to be larger in proportion to the increase in weight of the mother

Siddall and Mack (1935) reported that the total gain during the last four months of pregnancy was 15 7 pounds and concluded that excessive weight gain appeared to be of questionable value in the early recognition of impending toxaemia Cummings (1934) found the total gain in the first trimester of pregnancy to be less than half a pound in the second trimester 13 pounds and in the third trimester 11 pounds The greatest gain occurred during the sixth and seventh months in which it was 5 pounds He stated that an abnormal gain in weight was a very early sign of the toxaemias of pregnancy During the same year Harding and Van Wyck came to the same conclusion and therefore advised the practice of weight taking in pre natal care

The present investigation was undertaken to determine the weight increase in normal and toxaemic cases in an attempt to establish standards and to ascertain what significance could be attached to an abnormal gain

Method of Investigation

Each patient was examined during the last few months of her pregnancy weekly fortnightly or monthly depending on the findings at the previous examination A history of any previous illnesses and pregnancies was taken at the first visit together with a history of the present pregnancy A general systematic and obstetrical examination was also made the patient was weighed the blood pressure taken and an examination of the urine performed

---

* Investigation undertaken during the tenure of a British Medical Association Research Scholarship

function of the extrapyramidal system, as well as much of our knowledge of the physiology of sensation, still rest on clinico-pathological observations, and are differently conceived by different schools While it seems well established that lesions of the substantia nigra produce a Parkinsonian state and lesions of the corpus subthalamicus choreiform movements, and that certain lesions of the lenticular and caudate nuclei produce similar clinical pictures, we are still far from a full understanding either of the connexions or the functions of these structures, and little is gained by dogmatic statements of the teachings of one school The relation of painful sensation to the sympathetic system is another matter of controversy, most English authors holding that, although some fibres conveying impressions of pain run in the sympathetic chain, they are in all other respects similar to somatic sensory nerves The French view that there is true sympathetic pain still, however, has many adherents in this country

In spite of these failings there is so much valuable information in Dr Cossa's book that it is well worth reading by those interested in the science of neurology

HYGIENE

A Synopsis of Hygiene By W W Jameson M A M D, F R C P, D P H and G S Parkinson, D S O, M R C S, L R C P, D P H With a section on Personal Hygiene by G P Crowden, M Sc, M R C S, L R C P Fifth edition (Pp 623 21s) London J and A Churchill 1936

Rather more than two years ago we reviewed in these columns the fourth edition of Professor Jameson's *Synopsis of Hygiene* In the fifth edition, which now appears, much fresh material has been incorporated, especially in relation to the subject of public health law Among other topics including new points of practical interest are the conduct and cost of health weeks, the warming and lighting of buildings, and personal hygiene, the last of which is dealt with in considerable detail and ranges over a wide field The excellent articles on tuberculosis, venereal disease, hospital construction, and the welfare services have the merit of being at once informative and concise The recent Order on milk designations is presented, with its tuberculin-tested, accredited, and pasteurized grades and methylene-blue reduction test The consolidating Public Health Act of last year is well summarized

The fifth edition will be welcomed not only by students for the diploma but also by every medical officer who aspires to be up to date in public health affairs

Notes on Books

The main theme of *After Us* by Mr J P LOCKHART-MUMMERY is contained in the apposite subtitle *The World As It Might Be* (Stanley Paul and Co, 18s) The author traces the future evolution of modern tendencies in a logical and scientific manner which nevertheless brings him to such startling conclusions that it is not surprising to find Lord Horder's foreword written in guarded language In the chapter on Preferential Breeding a scheme of positive eugenics is set out, whereby all male children with the exception of a small number of selected strains with scientifically scrutinized pedigrees, should be sterilized soon after birth Should a woman desire a child she would be permitted, if free from hereditary taint to make her choice from a list of specified sires and receive an artificial insemination Mr Lockhart-Mummery argues that family life would be in no way outraged by this surprising arrangement The book also deals with questions of population, food, and transport, medicine and religion, indeed with all the essentials and accessories of human life In addition to visualizing conditions of the future the author skilfully dissects those of the present day His commentary on modern industry and finance is a scathing indictment This is a highly controversial book It shows evidence of a catholic range of knowledge on the part of one who has obviously devoted much thought to the problem of the betterment of the human race

In *Comrades in Adventure* (John Smith and Son Glasgow, Ltd, 3s 6d) Miss GERTRUDE RAMSAY looks at life as a pilgrimage of two companions, the ego and the body Many pages are devoted to their reactions to illness, acute and chronic The author states that good health is the result of a steady battle, an achievement which the vast majority do not sufficiently appreciate It is surprising to read in the sentence following this conclusion that "we are unutterably bored by the health statistics which show how pure food, good water, good drainage have reduced illness and lengthened life" The book is written in simple and almost conversational style, and the sentiments expressed may prove helpful to those suffering mentally or physically The author, however, is inclined to labour her points, and her theme might have been compressed into a much smaller compass

Standards are necessary for all accurate work and apparatus is required for making the requisite estimations In industry there are many problems of hygiene that can only be solved by accurate measurement of actual conditions followed by comparison with known standards The International Labour Office has now produced a hand book—*Industrial Environment and Health* (Geneva, International Labour Office 7s 6d) It describes instruments and methods, both physical and chemical, by which given situations can be compared with known standards The latter are accessible to all in the literature of the appropriate subjects but this is the first book of its kind to give handy and concise directions regarding the application of scientific analysis It should be invaluable to chemists, engineers, and designers, but it will be of great service to all engaged in industrial medicine and hygiene Few doctors will use it practically since they rarely have the specialized experience to apply the various techniques accurately If, however, they possess a copy it can be passed to the officials most likely to benefit, and the resulting data can then be analysed and reported on by the doctor This book should be in the administration library of every industrial concern and in the pockets of all who design and build factories

To say that certain truths and methods are now commonplace is by no means to detract from the tribute and acknowledgement due to those who at an early stage proclaimed and elaborated them, on the contrary, it is a statement of the success of those pioneers So, too the over-emphasis of a truth about health and a method of promoting health, with the result of establishing it as a cult, may be a real disservice by narrowing or misdirecting its application, and causing neglect of other truths and methods which are no less valid and useful It is well that in a little book compiled and arranged by A R CATON, entitled *Activity and Rest* (Philip Allan, 5s) the life and work of the late Mrs William Archer should be commemorated, and that the important truths that health means harmony, that there is such a thing as physiological and mental rhythm and balance and that periods of relaxation (in the fullest meaning of the word) are essential to fitness and valuable aids to the culture of health, should be again presented to the public Mrs Archer performed a real service by showing how relaxation of body might be most completely attained and by establishing (at King's Langley) conditions which contributed to such complete attainment This has now happily become an established feature in medical and psychotherapeutic practice

blood pressure were found at the same examination in ix cases, in a further six the blood pressure was raised on the average three weeks after the weight increase One of the remaining two patients complained of head aches and 'spots before the eyes" six weeks after the abnormal weight increase there being no rise in blood pressure the other patient developed oedema of legs hands and face three weeks later, the blood pressure being 130/80 mm Hg The following table gives the first indication of a toxaemia noticed in the fifty two cases under consideration

TABLE III

First Indication of Toxaemia	No of Cases	Percentage
Abnormal monthly increase in weight	34	65 3
Abnormal monthly increase in weight and raised B P simultaneously	9	17 3
Raised blood pressure	8	15 3
Albuminuria ,,	1	1 9

It would appear therefore, that an abnormal increase in weight during any one month is usually an earlier indication of an impending toxaemia than a rise in blood pressure

Loss of Weight before Labour

Loss of weight of the mother immediately before labour was found in only seventy-three of 207 cases a percentage of 36 In this series of cases therefore an impending labour could not have been diagnosed by the loss of weight of the mother These findings are comparable with those of Cummings (1934) and Siddall (1933), the former found that 40 per cent and the latter 24 per cent of their patients had lost weight before labour

Relation between Abnormal Weight Increase and Type of Labour

As mentioned previously Bingham found that an abnormal increase in weight predisposed to a more difficult labour In this series of cases fourteen primiparae and fourteen multiparae had an average gain of more than 5 pounds per month the remainder had an average monthly gain of less than 5 pounds, although some may have gained more than 5 pounds in a particular month.

The duration of labour and the forceps rate in these two groups are shown in Table IV

TABLE IV

	No of Cases	Average Duration of Labour	Forceps Rate
Primiparae (not overweight)	86	17 hours	24 (27 %)
Primiparae (overweight)	14	18.2 hours	4 (28%)
Multiparae (not overweight)	97	11 4 hours	9 (9%)
Multiparae (overweight)	14	11 hours	1 (7%)

The number of patients overweight is small therefore great stress cannot be laid on the result of the comparison, but it is evident that in the cases under consideration the type and duration of labour was not affected by the weight increase of the mother

Discussion

Increase in weight must obviously take place during a normal pregnancy but observers differ as to the amount In the articles quoted the figure varied from 12 to 24 pounds Many of the causes of the increase are self evident—namely the foetus 7 pounds the placenta 1½ pounds the amniotic fluid 2½ pounds and the enlargement of the uterus and its appendages 2 pounds

The general increase in the tissue of the mother including hypertrophy of the breasts must account for some gain in weight, which would vary with the type of woman concerned It is difficult to arrive at an average figure for this increase but it would probably be between 2 and 4 pounds

The increase in blood volume which takes place during pregnancy must cause a small part of the gain The blood volume is about 7 per cent of the body weight and would therefore be 8 8 pounds if the average weight of a woman of child bearing age is taken to be 9 stone The blood volume has increased at least 20 per cent at term thereby accounting for a gain of 1 6 pounds

During the first trimester it is universally agreed that there is very little variation in weight some patients losing a little and others gaining depending probably on the ease with which the body adjusts itself to the presence of the ovum The increase which occurs must therefore take place during the last six months It is suggested both on theoretical grounds and from the above results that the average monthly gain during the second and third trimesters should be between 2 and 4 pounds and the total gain 16 to 18 pounds If the gain is greater the patient should be questioned carefully, and be examined in order to find if possible the cause of the discrepancy

In the 211 cases under consideration it is clear that systematic weighing of the patient was of definite value in foretelling a toxaemia of pregnancy The average increase in weight of a potential toxaemic patient was definitely more than that of a normal patient, but it was not sufficient to be of real clinical value since the 4 3 pounds which was found to be the average monthly gain of the toxaemic patients, was as a rule gained by the normal cases during one of their later months If however, the patient has a *monthly* gain of 4 to 5 pounds in two or more consecutive months it should be regarded as abnormal dietetic errors if present should be rectified and a stricter supervision undertaken

On the other hand, a sudden marked rise in weight during one month, particularly if at least twice the normal gain is of great help in foretelling a toxaemia If the patient showed a monthly gain of 8 pounds or more there was a 63 per cent chance of her developing a toxaemia and following a 6 to 8 pound gain a 50 per cent chance It would appear therefore that it is the sudden abnormal increase in weight rather than the gradual gain which is of importance in detecting an incipient toxaemia Another fact which should be mentioned is that all cases which show this sudden gain do not develop toxaemia but almost all cases of toxaemia (98 per cent in this series) will have shown an abnormal increase at some time before the appearance of albuminuria

It has been shown that this abnormal gain is as a rule an earlier sign than a raised blood pressure but that occasionally the latter is the first indication Therefore ideal ante natal supervision should include the taking of the weight and blood pressure each month during the second trimester with more frequent observations during the last trimester If this is carried out almost all the toxaemias of pregnancy (97 per cent in this investigation) would be diagnosed before albuminuria appeared Treatment could then be given and the percentage of the maternal mortality due to the toxaemias of pregnancy should be materially reduced

WORK IN HYGIENE AND TROPICAL MEDICINE

A year ago the London School of Hygiene and Tropical Medicine had to report a large deficit At the annual meeting of the court of governors on January 19 it was announced that the accounts for 1935–6 showed a small credit balance This turning of the financial corner is due to continued generous support from industry, the renewal of contributions from certain colonial Governments which had had to suspend them at the time of the 1931 crisis, and the exercise of economy by members of the staff Sir Austen Chamberlain, chairman of the court, has been instrumental in raising over £8,000 to finance the combined researches of the Divisions of Bacteriology and Biochemistry on the isolation of chemical fractions of immunological value from bacteria Professor W W Jameson, whose five-year appointment as dean ended in 1936, has been reappointed to hold the office of dean concurrently with his professorship of public health In his report to the governors Professor Jameson mentions that the public health course has been somewhat recast and the course in tropical medicine and hygiene substantially modified Among the benefits of the rearrangement are that clinical teaching will be extended throughout the course of study instead of being restricted to the first part The system of teaching in the Division of Epidemiology and Vital Statistics has been altered When the school opened there were no modern books covering even approximately the field of epidemiology as now defined but several such treatises have become available, and it is therefore possible to diminish the time given to didactic lectures and increase the allocation to teaching of the seminar type Professor Greenwood the director of the Division says that no reforms of practice can prevent the D P H course from being a serious undertaking, but it seems clear that future students will have a less harassing time than their predecessors The holding of a part time course in mental deficiency has been approved this is intended for students of the D P H class and for a limited number of other students, particularly school medical officers The number of students admitted to the school in the year was 211 of whom 143 took the course in tropical medicine and hygiene, and thirty-nine the course in public health Since the school started in 1924 1,633 students have followed the first of these courses, and 291 the second Next to the British Isles the largest number of students (247) has been drawn from India and Ceylon These countries have also been the destination of the largest number of students (482), followed by West Africa (180), East Africa (164), and Malaya (137)

The separate records of the Divisions and Departments give an impression of continuing work, not to be conclusively reported on in any one year In the Division of Clinical Tropical Medicine the director, Dr G Carmichael Low, reports on his round-the-world tour with the British Medical Association, and calls attention to the fine hospitals at Singapore and elsewhere in the East ideal places he says, for young men keen on clinical work and research Dealing with the work of the Division during the year, he states that a good number of cases have been available for demonstration at the Hospital for Tropical Diseases but more are required, and these can only be obtained by carefully sifting the patients who pass through the Albert Dock and Tilbury Hospitals Research on the causes of sprue has been conducted by Dr Hamilton Fairley and some valuable results have been obtained, though the aetiology of the disease still remains uncertain The Department of Entomology carries out research work both at home and overseas, at home it has been concerned with the physiology of insects and in particular the effect of climate upon biting species A substantial research grant has been placed at the disposal of the school by the Royal Society for an extended programme of research on certain aspects of the physiology of the *Anopheles* Probably this work will be begun in London and continued at a selected spot in the Tropics The Division of Bacteriology and Immunology is proceeding on a study of experimental epidemiology aided by a grant from the Medical Research Council, which recently reported on the progress of this investigation Experiments are now being initiated to test the effect on the epidemic process of varying the closeness and continuity of contact of mice at risk and it is also intended during the coming year to apply to this investigation the results that have been obtained in the study of the relation of diet to resistance Work has been carried out also on the immunizing properties of the fractions obtained from *B aertrycke* and *B enteritidis* in a series of cross immunity tests Attention is being turned to *H pertussis* in the hope that combined chemical and immunological studies may isolate an immunizing fraction from this important human pathogen The work under industrial physiology includes an investigation into the types of employment open to deaf and

Sites Affected

Lupus affects the face more frequently than any other part of the body, and is commonly found in the region of the nose In an analysis of 310 cases I found that the face was affected in 238 or 77 per cent As a rule lupus is not manifest on many parts of the body at the same time but some cases show evidence of widespread disease One patient for example, had it on the buttocks thigh, knee feet wrists, and elbows Another had as many as fifteen patches of different sizes on his body These multiple patches generally follow measles or chicken pox chiefly the former, and represent a blood stream infection

In addition to the skin the mucous membranes may be involved—in the nose lips, gums mouth or pharynx No patient with lupus in the neighbourhood of the nose should be allowed to go without examination of the mucous membrane In many cases the mucous membrane is the starting place of the disease which spreads through to the skin In some cases however the skin of the nose is involved without apparent affection of the mucous membrane

Tuberculous Glands and Lupus

The relation between tuberculous glands and lupus must be stressed In an examination of 270 to 280 cases of lupus I found that almost 50 per cent followed cervical adenitis These are minimum figures because in many cases the site of the lupus made it certain that cervical glands had preceded the skin disease As no definite mention was made on the patient's record card however these cases are not included in the 50 per cent Van Vonno of Holland in an examination of about the same number of cases, found scars of submental or cervical adenitis in 71 9 per cent of his lupus cases

During the last six years I have treated *116 cases of* tuberculous adenitis in my light department at the Royal Infirmary These cases have been sent by surgeons for treatment of the glands Of these cases thirty three had discharging sinuses when sent for light treatment Had these patients not been given general light baths I am convinced that most if not all of them would have had definite tuberculosis of the skin before the sinus ceased to discharge In addition to these cases some patients already had involvement of the skin when sent for light treatment but they were referred for the gland condition and not for treatment of the skin disease If the curative effect of ultra violet radiations in tuberculous adenitis were more widely recognized a great step forward in the fight against tuberculosis of the skin would be achieved

Lupus vulgaris is an extremely chronic disease progressing insidiously from month to month Occasionally it disappears spontaneously, sometimes it develops rapidly but at other times it appears to remain stationary It is a pity that the disease is not painful, as the want of discomfort causes the patient to neglect it and not to seek advice when that would be of most value The intractible nature of the disease leads to an accumulation of patients, and so the number of cases attending the clinics grows steadily larger In some ways it is an advantage to have some extensive cases attending at the same time as the early ones I point out to those with a small patch what they will become like if they do not attend regularly for treatment and I also show a patient who has improved greatly as the result of steady treatment In this way new patients can be induced to attend more regularly than they might otherwise do

The healing of the disease leads to scar formation and while the cosmetic result is in some cases excellent in others the scar is unsightly The contraction of the scar not infrequently leads to considerable deformity when the disease is in the neighbourhood of the natural orifices Ectropion is seen when the eyelid is involved On the nose the disease may lead to narrowing of the nostrils while the tip of the nose may become thin and pointed In other cases the nostrils may become distended while at the mouth there may be distortion or the orifice may be inconveniently narrowed When the lupus is situated in the neighbourhood of a joint the resulting contraction of the scar may lead to great restriction of movement One end result of the contraction of the scar I have not seen mentioned so far as I can recollect When the lupus is situated in front of the neck the scar tends to break down as the result of the constant movement of the head The continued movement prevents the wound healing and the constant irritation of the parts leads to the development of carcinoma I have seen several cases during the last few years where this seems to have been the sequence of events

Reasons for Diminishing Incidence

I have mentioned that the incidence of lupus is diminishing This is due chiefly, in my opinion to the fact that in many places tuberculous glands are now being treated by means of general light baths instead of surgically

I have already indicated the considerable percentage of gland cases with sinuses which I have been asked by surgeons to treat during the past few years at the Royal Infirmary, and I had the same experience in my light department at Leith Hospital This experience is not merely my own It is quite a common one among those who are accustomed to light treatment—sanatorium medical officers, for example Some years ago Dr John Comrie read a paper before the Medico Chirurgical Society of Edinburgh on The Medical Treatment of Surgical Tuberculosis He gave his experience at Rollier's clinic at Leysin and showed photographs of patients with sinuses and involvement of the skin where the skin infection and the gland mass had cleared up under light treatment If a gland mass will clear up when there is a sinus it will surely do so before a sinus has formed The large mass of glands with periadenitis where the glands are matted together and adherent to the deeper tissues is the type of case leading to sinus formation This is exactly the type of case so suitable for ultra violet irradiation and as more and more of these cases are irradiated we shall see fewer cases of the scrofulodermia type of tuberculosis of the skin This applies also to those cases of bone and joint tuberculosis which so often advance in spite of all ordinary surgical measures and form abscesses Incidentally it may be said that the amount of movement obtained in these joint cases as the result of radiation treatment is far in excess of that obtained by surgical measures Subsidiary causes for the diminished incidence of lupus are the larger amount of fruit and vegetables now eaten and the clearing away of slums while the medical inspection of school children also has its bearing

General Treatment

General treatment includes all those hygienic and dietetic measures which apply to the treatment of all forms of tuberculosis The Gerson diet has its advocates and its opponents but it is hardly a feasible proposition for a working-class household—the class in which most cases of lupus are found Even the advice that patients take plenty of good nourishing food is hardly possible in many

multiple pathological fractures of bone and four had changes in the lens Treatment must depend to a large extent upon the individual patient's various symptoms The Dublin report suggests that the fat intake should be reduced to about 50 grammes a day unless diarrhoea is severe, protein should be kept high at about 120 grammes, and the carbohydrate intake is determined by the degree of abdominal distension from intestinal fermentation In this connexion ripe bananas have been found to be as useful in adults as they are in the coeliac disease of children The not infrequent achlorhydria is treated by hydrochloric acid by the mouth, and vitamin D and calcium must also be given Iron is presented in large doses for hypochromic anaemia, and injection of liver extract has been found useful in the hyperchromic types Along these lines the results are stated to have been gratifying, and eight out of the ten patients are reported as now leading practically normal lives

TYPHUS AND TYPHUS-LIKE INFECTIONS

Drs Yves Biraud and S Deutschman have made an exhaustive study[1] of the important subject of the geographical description and epidemiology of typhus and typhus-like rickettsia infections to which a remarkably full bibliography of recent literature is appended A survey is given of these diseases as they occur (1) in Europe and the Mediterranean basin, including Northern Africa, (2) in tropical and Southern Africa, (3) in North and South America, (4) in Asia, and (5) in Australia The increase of louse-borne typhus during the past five years, not only in Eastern Europe but also in Northern and Southern Africa, South America, and Mexico, is attributed partly to the disappearance of the population immunized during the war and post-war pandemic and partly to the effect of the lasting economic depression in rural areas During the last fifteen years typhus in Europe has occurred in three distinct regions—Central and Eastern Europe to the east of a line from the Gulf of Finland to the Adriatic, the Iberian Peninsula, and the British Isles The first region is the most important, while in the other two there is merely a winter or spring recurrence of small and sharply limited outbreaks Besides classical typhus two other forms of exanthematous diseases have recently been affecting Mediterranean countries—namely boutonneuse fever and murine typhus In Africa the distribution of typhus and typhus-like diseases is as follows louse-borne typhus is still endemo sporadic in North Africa, it is endemo-epidemic in Egypt among the Bantu population of Basutoland and the Union of South Africa and South-West Africa it has also recently appeared in South-West Uganda and Urundi Murine typhus has been found in the ports and inland towns of North, West, and South Africa among rats and human beings Tick borne typhus-like diseases are to be found throughout North Africa and in the form of boutonneuse fever and also in Central (Kenya) and South Africa as tick bite fever Turning to America we learn that Canada is practically free from all forms of typhus In the United States louse-borne typhus, though repeatedly imported from Europe and Mexico, has proved incapable of taking root in recent years The benign form of typhus known as Brill's disease still prevails in New York, Massachusetts, and Connecticut but the cases are few It is distinguished from classical typhus by its lack of communicability, peculiar autumnal incidence, and its mildness (mortality below 1 per cent) Murine typhus occurs in the Eastern and South-Eastern States, where it has become increasingly prevalent, and has a fatality of about 5 per cent In Mexico louse-borne typhus under the name of "tabardillo" has been endemic for centuries, with a fatality rate of 40 per cent in Mexico and slightly lower in other cities In Guatemala the disease is practically confined to the higher regions In South America louse-borne typhus is by far the most important form in respect of the number of cases reported and the area of its distribution, but murine typhus is also found in Northern Chile, on the coast of Peru and in the Argentine In Asia the form which is the most widespread and causes the greatest number of cases is louse-borne typhus, which is prevalent in the northern half of the continent and extends southwards to the mountainous parts of Iran, Afghanistan British India, Northern Indo-China, and South-Western China In addition to epidemic typhus three main forms of sporadic typhus exist in India, the first of which is clinically and serologically identical with the tropical scrub typhus of Malaya the second, which is more severe and sometimes fatal, prevails in some southern districts (Deccan and Poona) from July to December while the third type, found among the natives of South India, is closely allied to benign murine flea-borne typhus In Malaya, where tropical typhus was first described by Fletcher and Lesslar in 1925 three types of typhus-like diseases are recognized—namely, (1) "scrub" or rural typhus, which is the commonest and most severe, (2) "shop" or urban typhus, and (3) Japanese river fever or tsutsugamushi In Australia louse-borne typhus disappeared in 1869, since when two distinct forms have existed One on the eastern coast of tropical Queensland is known as coastal fever, pseudo-typhus, or sugar-cane typhus while a similar but distinct form occurs in the non-tropical part of Queensland

WORKING-CLASS DIETARIES

The medical officer of health and the City Health Department of Newcastle-upon-Tyne[1] are to be congratulated on their dietary survey of sixty-nine families during a period of one week This method of estimating the nutritional standards of a community is becoming increasingly popular all over the world Though not infallible it is of value in that to a limited extent it consists of facts Facts about nutrition are badly needed in a field where opinions are so often quoted depending more often on political or social prejudice than upon accurate observation and range from the view that there is no nutritional problem in

[1] *A Study of the Diets of Sixty-nine Working-class Families in Newcastle-upon-Tyne* City Health Department, Town Hall, Newcastle upon Tyne (1s)

It will be readily apparent then that blood group tests may offer conclusive evidence that a certain man could not be the father of a particular child but can *never* prove that he *is* the father The only possible exception to this is where it can be established that one of two men must be the father Wiener cites an interesting example of such a case A woman wished to know whether her husband or her lover was the father of her child Tests showed that husband lover and child were all of group A so that no decision could be given by the A and B tests On determining the M and N types it was found that the mother, child and husband were of type M while the lover was of type N thus proving that the lover could not be the father It was established therefore that the husband was the father of the child

It is of interest to compute the chances if we determine the groups of the mother child and accused man of finding one of the impossible combinations and thus proving the man's non paternity This chance varies with the group of the accused and is influenced by the incidence of his group in the general population

Probabilities of Establishing Non paternity with the A and B Tests (After Wiener)

Group of Falsely Accused Man	Probability (Approximately)
AB	2/5
A	1/13
B	1/7
O	1/4
Unknown	1/6

Probabilities of Establishing Non paternity with the M and N Tests (After Wiener)

Type of Falsely Accused Man	Probability (Approximately)
M	1/3
N	2/5
MN	0
Unknown	1/6

The new M and N tests have doubled the chances of proving non paternity and in conjunction with the A and B tests afford expectation of evidence of non paternity in one case in three on the average The probability is highest (2/3) in accused men of type ABN and lowest (1/13) in type AMN Lauer, cited by Wiener reports that since the discovery of the M and N factors many old cases have been reopened in Germany by men who were supporting children under a decree of court because the tests for A and B did not exclude them in the hope that the M and N tests might establish their innocence

Other problems in which blood group tests may be of value include false maternity and the interchange of infants

Practical Application

An examination of the literature reveals that the foregoing theories of the inheritance of the agglutinogen substances of the human blood corpuscles have been amply confirmed by the study of the blood groups in large numbers of families by many independent investigators throughout the world As these records grew it became apparent that blood group tests might be applied to cases of disputed paternity Though the chances of success were limited when only the older Landsteiner group tests were available it will be seen below that a considerable use was made of the tests on the Continent After 1928 when the M and N blood types were discovered the value of blood tests was enhanced owing to the greater chance of coming to a definite decision and perhaps in a few years we may have X and Y types to enhance still further the value of the tests The legal history of the tests is as follows

1910 Von Dungern and Hirszfeld indicated the possible value of blood group tests in disputed paternity cases

1924 The evidence of blood tests was first employed in the German courts

1929 Up to this time the tests had been used in over 5 000 cases of disputed paternity in Europe alone

To day although accurate figures are not available the number of times the tests have been employed must be of the order of tens of thousands for they are in use in Austria Belgium Czechoslovakia Denmark Italy Japan Lithuania Norway Sweden Switzerland and have been used in the Irish Free State In the United States of America the tests are employed more particularly in the States of New York and Wisconsin and it is believed that steps have been taken in these States in connexion with special legislation to make the tests more readily available

In this country it has to be put on record that except for one or two isolated occasions no use has been made of the blood group tests and it may be of moment to examine the reasons for this

The first is that most litigants and even lawyers are unaware of the test and its possibilities The second is perhaps a certain distrust of scientific method among the lay magistrates a conservatism which is to a large extent part of the national character This attitude is an admirable one to adopt when dealing with any new test that has not been established beyond all reasonable doubt, but the blood group test has gone far beyond the experimental stage and its reliability is fully established Thirdly owing to a misunderstanding which appears to exist in some legal minds it is suggested that a failure of the test to make a decision of non paternity available may create an impression in the minds of those who have to make the final decision that the accused man is in fact the father When the rationale of the test is better understood such an argument will be found to be without foundation Fourthly the use of the test in these cases must always be demanded by the alleged father as it is he who sets out to prove his innocence and it is he only who can benefit by it Even if the accused man knew of the tests and desired to submit to them the court would have no power to compel the woman applying for the affiliation order to submit to the examination and might not be justified in drawing any inference from her refusal Fifthly, at the present time the test is somewhat costly and beyond the pockets of the poorer class of defendants but this would soon be remedied if sufficient cases were forthcoming

While we do not pretend to have any legal knowledge and are subject to correction on this point we believe that an essential difference in the legal practice largely accounts for the extensive use of the test in other countries Power we understand, is given in many countries in Europe to the court to order the performance of the tests—that is scientific evidence is in general obtained at the instruction of the court so that no onus in this respect is placed on the litigants This practice has many points in its favour as the scientific witness is a court witness and is not a party witness *It is believed* that the new legislation in America is designed to meet this difficulty so that the court may be in possession of this evidence

Conclusion

In conclusion attention may perhaps be called to the fact that cases of this type unfortunately common before courts of summary jurisdiction and occasionally featuring elsewhere—for example the Russell case—are amongst the most difficult in which magistrates have to exercise their judicial powers and tragic miscarriages of justice are not unknown In the recent report of the Departmental Committee on *Imprisonment by Courts of Sum-*

sanitary precautions, the water supply was bad, and the food was contaminated by dust and flies Typhoid broke out at Beechworth in 1856 and occurred year after year until the doctors learned of the part played by "carriers" and discovered some in a family which had for years supplied the town with food One of the most difficult problems was an influx of dozens of Orientals, who knew neither English nor sanitation and suffered from leprosy, hookworm, filaria, and other Eastern diseases Small-pox and typhus were controlled by quarantine and never obtained a footing Many of the doctors on the diggings seem to have been extraordinarily efficient, self-reliant, dependable, and helpful to their widely scattered patients Every long-settled district has traditions showing the esteem in which some of the old doctors were held

"HUMAN BITE" INFECTIONS OF THE HAND

Infections of the hand are being better treated to-day than they were but ten years ago This improvement is largely the result of a fuller knowledge of the surgical anatomy of the fascial spaces and tendon sheaths, their mode of infection, and the best methods of dealing with infected areas In this connexion the work of investigators such as Kanavel of Chicago has been all-important, and serves to show that human anatomy is by no means a science that is "worked out," as some would claim At the Annual Meeting of the British Medical Association in Bournemouth in 1934 one of the chief points in a debate on the treatment of infections of the hand was the necessity for regarding these lesions as of major surgical importance and of admitting such cases to the hospital wards In a recent paper[1] Claude E Welch of the Surgical Service of the Massachusetts General Hospital draws attention to an aspect of hand infections that has hitherto received only scant consideration—namely, "human bite infections" Only eighteen cases were discovered in a search of the records of the Massachusetts General Hospital which covered a period of eleven years but undoubtedly many patients sustain small lacerations and mild infections from bites and do not attend hospital Welch estimates that bite infections constitute about 1 per cent of the cases of infection of the hand admitted to the hospital wards for treatment These infections usually arise as a result of one person striking another in the mouth The impact of a tooth produces a lacerated wound over the knuckle of the index or middle finger The wound is usually tiny but deep, and may penetrate the expansion of the extensor tendon and enter the metacarpo phalangeal joint For from six to twelve hours there may be little discomfort but then the back of the hand becomes swollen and dusky movements at the joint are painful, and malaise and pyrexia develop When pus escapes it is malodorous, and has been compared with that from a lung abscess The essential features are the site and nature of the lesion the tendency for it to involve the joint and the character of the purulent discharge The infection is usually foul and mixed with streptococci and staphylococci diphtheroids and spirochaetes If spirochaetes and fusiform bacilli are present in abundance the prognosis is worsened and early amputation may be called for In the more severe cases of joint infection Welch believes that it is wise to incise both adjacent web spaces, divide the lateral ligaments of the metacarpo-phalangeal joint, and open the capsule widely For early cases he advises diathermy excision of the laceration He finds that amputation of the affected finger is required in one out of ten cases treated within twelve hours, if operation is delayed for from one to seven days amputation will be necessary in one out of three cases, and half of the others will retain a comparatively useless finger

THE INFLUENZA EPIDEMIC

The epidemic is proceeding on normal lines and there is no reason to expect that it will prove either as widely spread or as severe as that of 1933 It is spreading to the North, and reports all suggest that it is conforming in type to what we have been experiencing in the South-East and the Midlands The weekly number of deaths shows a steady increase, but it must not be forgotten that this number is bound to be weighted by serious cases in which the illness began either in the week preceding or even earlier The same applies to the number of cases in hospital, as the figures for each succeeding week are cumulative, inasmuch as some cases are carried forward In London the number of notifications of pneumonia was 454 in the week ending January 16, an increase of thirty-seven over the number for the previous week, but that this is not indicative of an extension of the epidemic is shown by a marked falling off in requests for admission to hospital The deaths from influenza in London were 344 for the week ending January 16, as against 311 in the previous week With the prevailing acute pressure on beds in hospitals of all types the extent of the demands received for beds for influenza cases in the London County Council hospitals is a reliable guide to the number of cases thought by private practitioners to be serious enough for hospital treatment The figures for the past three weeks are therefore of great interest they were—for the weeks ending January 2, 9, and 16, 1,377, 1 602, and 921 respectively The clinical picture shows no change, pneumonia being still exceptional and occurring comparatively rarely in the young adult age groups this is completely at variance with the experience of 1918, and gives still further justification for the opinion that, distressing and inconvenient as it admittedly is, the present epidemic is not likely to be of major public health importance

HALF-YEARLY INDEXES

The usual half-yearly indexes to the *Journal* and to the *Supplement* and *Epitome* have been printed they will however, not be issued with all copies of the *Journal* but only to those readers who ask for them Any member or subscriber who wishes to have one or all of the indexes can obtain what he wants, post free, by sending a postcard notifying his desire to the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W C 1 Those wishing to receive the indexes regularly as published should intimate this

Clinical Memoranda

Crude Cod-liver Oil in Treatment of Wounds

Having read of the cod liver oil treatment of wounds (Steel 1935) I was encouraged to make use of a crude cod liver oil dressing as a routine, and have come to the conclusion that it has marked healing and aseptic properties Besides being cheap it is applicable to all kinds of wounds I started using it first for minor injuries and indolent chronic ulcers In order to estimate the efficacy of this method half my cases were treated with recognized antiseptics such as acriflavine mercurochrome eusol etc, while the other half were dressed with crude cod liver oil Not only minor injuries did well but its application was justified in deep and extensive wounds Satisfactory results having been obtained in the out-patient department it is being used for dressing cases after operation The following cases illustrate the gratifying results

CASE REPORTS

A girl aged 10 had injured her tibia as a result of a fall a year ago She attended the hospital because she began to have pain and a slight swelling was noticed over the tibia An x-ray examination was advised but the parents preferred the treatment of an unqualified man who incised the swelling and had attempted to scrape the bone The girl again attended hospital because the wound refused to heal and was very dirty exuding foul pus in large quantities the swelling of the bone also had extended further In the hospital the usual operation for osteomyelitis was performed but the wound was badly infected and every day a large amount of pus exuded After a fair trial with acriflavine mercurochrome and brilliant green without much success the wound was dressed with crude cod liver oil Within a fortnight it was full of healthy looking granulations and there was very little pus The wound completely healed in a few weeks and the patient was discharged cured

A man was admitted for a gunshot wound of the right leg The bullet had splintered the tibia and some of the fragments of the bone had penetrated the calf muscles The wound was very dirty and to stop the bleeding the villagers had applied some substance which was mixed with road dust After taking the necessary surgical steps we started using for dressing mercurochrome acriflavine and other antiseptics but the wound would not heal and green pus continued to discharge After giving a fair trial to the above mentioned antiseptics we tried crude cod liver oil The discharge lessened there was none at all after the twelfth day and the wound was full of healthy granulations Just for a trial instead of using crude cod liver oil we used pure cod liver oil Our findings were interesting—granulations soon began to look pale and the healing slowed down considerably On resumption of crude oil for dressing the wound again started healing and within a few weeks the patient was discharged cured

We obtained equally good results in patients very badly burnt A man was brought to the hospital burnt all over the body face abdomen and extremities had third-degree burns He was admitted in a collapsed condition We started dressing straight away with the crude cod liver oil within a month he left the hospital and when we saw him after two months there was neither scarring nor pigmentation of the skin

Many other cases have given similar good results with crude cod liver oil treatment It seems that the crude cod liver oil has some healing property for skin tissues and even bones Crude oil seems to be better than pure cod-liver oil and it would be interesting to know the cause of this difference Is it that some factor in crude oil which has healing properties is removed or destroyed during the process of purification?

Tubercle Bacilli in the Cerebro-spinal Fluid Recovery

The following case may be of interest A woman aged 31 years was admitted to the City Mental Hospital, Portsmouth on February 6 1936 There was a history that for a month past she had been restless and depressed Three days before admission she ran into the garden of her home and fell heavily striking the back of her head A sister of the patient stated that for some time past she had been unduly irritable and unable to concentrate, also having complained of severe headaches

On admission she was suffering from an acute confusional psychosis She was restless noisy rambling and incoherent resistive to attention constantly stripping off her clothes and exposing herself Temperature was 100·2 F pulse 90 respiration 34 Physical examination was difficult owing to her mental state *X* ray examination of the skull was negative

On February 18 because of the prolonged pyrexia headache and irritability alternating with periods of drowsiness a lumbar puncture was performed under a general anaesthetic The cerebro spinal fluid was not under increased pressure but was slightly turbid The fluid was examined bacteriologically by Dr J A D Radcliffe of the Portsmouth Royal Hospital and his report was as follows Pus cells and tubercle bacilli present, lymphocytes were increased culture of the fluid was sterile

On February 24 temperature was 99 F pulse 80 Her mental condition had improved She was quieter and less confused and there were no physical signs of meningitis On February 29 a lumbar puncture was again carried out Fluid was not under pressure it was quite clear The bacteriologist reported that globulin was present in excess sugar 0·08 per cent there were a few pus cells and increase of lymphocytes tubercle bacilli not present culture sterile

From February to June her physical condition continued to improve but her mental condition varied from week to week At times she was depressed seclusive and self absorbed refusing to speak or to answer questions at other times she was bright and cheerful and answered questions quickly correctly and intelligently From July 15 her mental condition began to show marked improvement On July 24 a lumbar puncture was again performed The report was Fluid clear no clot globulin *nil* Microscopical examination no pus cells *tubercle bacilli not found culture sterile*

On August 26 her physical condition was good *There were no physical signs of disease* and her weight had increased by 12 lb She looked and felt well Her mental condition was normal she conversed readily and rationally and occupied herself usefully Up to the present her improvement has been maintained During the day she is busy in the needle room and in the evenings entertains the patients as she is a capable pianist She is being discharged from the hospital in the near future

I am indebted to Dr T Beaton O B E medical superintendent of the hospital for permission to publish the notes of this case

THE INFLUENCE OF THE ASSOCIATION ON LEGISLATION

PART I

One of the avowed objects of the British Medical Association is to maintain the honour and interests of the medical profession The performance of this task on behalf of a profession which is in close contact with almost every phase of the national life and on which social legislation imposes numerous duties demands the existence of a powerful central organization with the authority, the experience, and the financial means to act quickly and effectively as soon as legislative proposals affecting the profession are announced, and even, when desirable, to anticipate them This collective protection benefits each individual practitioner, for statutory requirements pervade every aspect of medical practice The relations between medical men and public bodies are in many ways governed by legal enactments, and the profession is dependent upon the law to preserve some of its privileges from encroachment by practitioners who are medically unqualified The amount of work which the British Medical Association as the representative professional organization, is called upon to perform in connexion with Parliamentary proceedings is enormous, and its value to the profession and to the public is incalculable In this article it is proposed to illustrate by means of a few of the more outstanding instances how the course of legislation has actually been affected by the Association's efforts

Various methods are adopted by the Association in this part of its work The scrutiny of Bills affecting the profession is part of its office routine and any proposal which is likely to react adversely on the practice of medicine or on medical practitioners is at once discussed with the proper authorities Government Departments, which recognize the Association as the organization representative of the profession as a whole, are usually willing to give sympathetic consideration to any amendments it may propose to a Government Bill, and they often give it the opportunity of commenting on their legislative proposals before a Bill is introduced into Parliament Close co-operation is maintained also with the Parliamentary Medical Committee, most of the members of which can be relied upon to support the Association's policy in Parliament and there are a number of individual lay members who have given valuable help from time to time Another way in which the Association has exerted pressure on Parliament is by the submission of its views to Parliamentary Committees which often ask it to provide evidence At the present time measures designed to strengthen the Association's political influence are under consideration

National Health Insurance

The *causa celebre* of the Association's Parliamentary work is perhaps the fight over the National Health Insurance Bill in 1911 Although the history of this conflict is well known at least in its main outlines its influence on the future of the profession was so vital and profound that it is well to reflect occasionally upon the full significance of the Association's success, and upon the degree of concerted action among medical practitioners that it was necessary for the Association to secure in order that the profession might achieve its victory

It will be remembered that the Government did not consult the medical profession during the early stages of the preparation of the scheme that the original proposals placed the control of medical benefit including the appointment of doctors, in the hands of approved societies and that no provision was made for the representation of the profession on any of the bodies entrusted with the administration of the system Immediately after the introduction of the Bill the Association formulated its policy in its "Six Cardinal Points," which included free choice of doctor and patient, the administration of medical and maternity benefits by Insurance Committees and the investment of medical committees with the control of professional discipline The Association then began an intensive campaign to awaken the profession to the danger that threatened its independence The response was immediate and whole-hearted and the Association supported by the signatures of 26,000 practitioners to a pledge to refuse service under the national health insurance scheme except on terms which accorded with its declared policy, and by the formal resignations of 33 000 doctors holding contract appointments with friendly societies gained most of its points during the protracted negotiations with the Government

The Association's achievement was of the highest importance to its own status and to the future of the profession During the fight its authority was undisputed, and its firm refusal to allow any lay body to take part in the arrangement of professional terms of service has ensured to the profession direct access to Government authorities whenever negotiations on medical matters are needed Medical practitioners themselves were saved from subservience to the approved societies, and the intrusion into insurance practice of the evils of the old forms of contract practice was prevented These results have been very far-reaching in their influence for national health insurance practice not only affects a large proportion of the population but also sets the standard for other forms of contract practice

Unqualified Encroachments

Of scarcely less importance to the profession than the preservation of its freedom from lay control is the prevention of encroachment upon its sphere of practice by persons who are medically unqualified There are several groups of such persons who claim to be capable of diagnosing or treating conditions which demand the services of a fully trained medical practitioner A number of Bills proposing the statutory registration of such groups have been introduced but so far the Association has successfully opposed them The recent defeat of the Bill for the Registration and Regulation of Osteopaths is still fresh in the minds of practitioners This result was primarily due to the Association's organization of the evidence submitted on behalf of the profession to the Select Committee appointed by the House of Lords to consider the claims to recognition made by the promoters of the Bill The Association not only prepared its own Memorandum of Evidence, retained eminent counsel to attend all the meetings of the committee, and nominated distinguished practitioners to give evidence on its behalf but it also co ordinated the evidence submitted by the medical faculties of the universities and other medical bodies and by individual medical practitioners The cumulative effect of the medical evidence was overwhelming and it was not very long before the representatives of the osteopaths asked leave to withdraw their Bill Here again the Association was accepted without question as the recognized mouthpiece of the profession and here also was an illustration of the essential need to the profession of a watchful central organization, prepared for emergencies and equipped with the means to undertake an expensive defence of medical practice

ideal textbook for the beginner It is beautifully printed and well illustrated The authors are to be congratulated on the accurate presentation in simple form of the essentials of roentgen interpretation

TOPLEY AND WILSON'S BACTERIOLOGY

The Principles of Bacteriology and Immunity By W W C Topley M A M D M Sc F R C P F R S and G S Wilson M D F R C P D P H Second edition (Pp 1 645 276 figures 50s net) London E Arnold and Co 1936

It only seems a short time ago that we had the pleasure of reviewing Topley and Wilson's *Bacteriology* yet seven years have elapsed since it first appeared And during those years the science of bacteriology has been advancing with rapid strides—so much so that the preparation of the second edition of this textbook must have entailed an enormous amount of work How well the authors have achieved this task is soon apparent, for turn where one will, the information is right up to date and presented with a clarity and balance that makes both instructive and stimulating reading As in the original edition the book is divided into four parts general bacteriology systematic bacteriology infection and resistance, and bacteriology as applied to medicine and hygiene but instead of being in two volumes the new edition is bound as one And since the book has increased by 300 pages this single volume is in truth a ponderous tome No doubt there are solid arguments in favour of combining the two volumes in one but this makes it almost impossible to carry the book about, and since it is so good that the reader will want to refer to it both in the laboratory and at home in the evening the only solution to the difficulty will be to possess two copies!

The lay out of Part I has not undergone any radical change but there is a new and valuable chapter on antigenic structure originally this subject formed part of the account of serum reactions Part II has mainly undergone amendment in detail though the chapter devoted to the methods of obtaining pure cultures and their identification which appeared in Part I of the first edition, is now made the opening chapter of Part II, a much more logical arrangement There is also a new chapter on the micro organisms of bovine pleura pneumonia and agalactia of sheep and goats which the authors very rightly separate from the filterable viruses The general account of the filterable viruses is now illustrated by some of Barnard's excellent photomicrographs which have reproduced here quite well The aspect of Part III has changed a good deal It starts with an admirable account of the types of immunity, and this is followed by a consideration of the measurement of immunity in the living animal and the assessment of significance—a most instructive chapter Then there is a new chapter in this section on immunity to virus diseases and it is interesting to note that the authors conclude that no essential difference exists between viral and bacterial immunity a view to which virus workers in this country at any rate would subscribe Each chapter in this section of the book ends with a most useful summary

Part IV remains much as it was in broad outline but each chapter has been brought up to date and in some instances this has entailed their being rewritten Filterable virus diseases now receive four chapters in place of one these diseases being grouped—not classified for that as yet is impossible—according to the situation or type of the essential lesion of the skin the central nervous system catarrhal or generalized infections and those giving rise to the formation of tumours This grouping no doubt finds its sanction in expediency and is as good as any at the moment, but it results in zoster appearing in the first group—those characterized by lesions of the skin—whereas its essential lesion is in the central nervous system Perhaps it would be better too, if the term herpes zoster were dropped and the disease called simply zoster, since this virus has no relation to that of herpes And small pox and varicella are placed in the group characterized by skin lesions and thus separated from measles though all three probably have their primary lesion in the respiratory mucosa generalization resulting in the secondary cutaneous lesions the exanthem

In their preface to the new edition the authors invite criticism, but it is difficult to find anything but praise for this excellent book When it appeared seven years ago it soon claimed many admirers this revised edition cannot fail to enhance its reputation

FUNDAMENTALS OF NEUROLOGY

A Preface to Nervous Disease By Stanley Cobb A B M D (Pp 170 13 figures 15s 6d) London Baillière Tindall and Cox 1936

Physiopathologie du Système Nerveux Du Mécanisme au Diagnostic By Paul Cossa (Pp 690 193 figures broché 65 fr cartonné toile 75 fr) Paris Masson et Cie 1936

Neurology has been studied as a science for longer than any other branch of medicine But its scope and complexity are such that few have attempted in any comprehensive manner to formulate the scientific data on which it is based Attempts to do this are made by Dr Stanley Cobb and by Dr Paul Cossa Both books cover in greater or less detail the whole field of nervous integration and disintegration from the simplest spinal reflex to the highly complex processes of speech and thought To achieve great success in such a task is probably beyond the powers of any one man and neither of the present books is wholly satisfactory Dr Cobb's is evidently intended for undergraduate students It is unpretentious simple in style and errs where error is made in over simplification of complex facts For greater conciseness some facts are stated in semi diagrammatic summary but the information given is accurate and up to date and as a students introduction to the study of nervous diseases it achieves its purpose well enough

Dr Cossa's survey is more elaborate filling nearly 700 closely printed pages While most attention is paid to disturbances of nervous function each part of the nervous system is examined in detail so that eventually a fairly complete system of nervous semeiology is presented to the reader The histological constitution of the nervous system and its alteration in disease are dealt with summarily most space being devoted to the clinical evidences of disease or degeneration in the nervous system Where this book fails is not so much in its scope and manner of presentation as in the many errors and misstatements which it contains Most of the recent developments in the physiology of the nervous system have been attained by the work of English and American physiologists and many of these have not received due recognition in France or if recognized have not yet displaced older and less well-founded views It is indeed to remedy this ignorance among his fellow countrymen that Dr Cossa has written this book and as a remarkably full survey of the subject it is undoubtedly valuable If the space allotted to ground less speculation and preconceived theory had been used for a clear and full statement of the more fundamental of the established facts its value would have been still greater Undoubtedly many aspects of the physiology of the nervous system, such as the mode of integration and

Hypodermic Needles

An Insurance Committee has considered a communication received by the Local Medical and Panel Committee from the Medical Advisory Committee of the Diabetic Association stating that several complaints have been received by them relating to the poor quality of the hypodermic needles supplied to insured persons It was suggested that the needles are usable only for a short time and are consequently more expensive ultimately than a better-class needle would be Hypodermic needles may be supplied to insured persons as part of their medical benefit only if they are required for the self-administration of insulin and the price allowed for the needles which at present is 2 8d each (2s 9 6d per dozen) is determined by the Minister of Health The observations of the Pharmaceutical Committee in connexion with the quality of the needles at present supplied have been obtained and the Insurance Committee has decided to refer the question to the National Association of Insurance Committees for consideration as to whether representations should be made to the Minister of Health to make provision for a better-class needle to be supplied

Ophthalmic Treatment

A practitioner has raised the question as to the necessity for submitting form G P 45 in respect of ophthalmic services rendered to insured persons on his list as an additional benefit and paid for as such by the approved society The ophthalmic treatment as provided by him includes testing vision with cards, examination with ophthalmoscope retinoscopy subjective test with lenses, and prescription for glasses required and it would appear that these services might be taken as outside the range of medical benefit

The practitioner deals with sixty or seventy cases annually in this category and a much larger number in respect of insured persons not included in his list where no question arises in connexion with form G P 45

It appeared to the practitioner that the submission of form G P 45 to the committee was unnecessary, and he asked the Insurance Committee for a ruling on the matter The committee has referred the question to the Ministry, and has been advised that the fact that a fee may be paid by an approved society instead of by the insured person does not affect the practitioner's obligations to comply with the requirements of the Terms of Service that form G P 45 must be submitted in all cases

PHYSICAL MEDICINE

REPORT OF ANNUAL CONFERENCE

A meeting of the Group of Practitioners of Physical Medicine was held under the chairmanship of Dr C W Buckley at B M A House on January 8 Twenty members were present

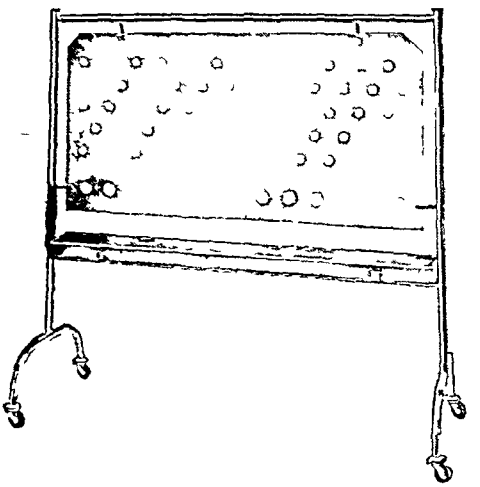
Scope of Activity

The first matter before the meeting was the relation of the Physical Medicine Group to the newly formed Radiologists Group and to the Spa Practitioners Group Dr Buckley pointed out that the Physical Medicine Group was the first group of the Association to bear a child Although a number of members had been transferred from the Physical Medicine Group to the Radiologists Group he did not think that the formation of the latter could be detrimental to the interests of practitioners of physical medicine They must, however, decide what were to be the respective spheres of the two groups The new group would probably confine itself to x rays and x-ray therapy and to the use of radium Some members suggested that if this were so the term "rontgenologist would be more accurate than "radiologist, which had a much wider connotation After discussion it was decided to ask the Group Committee to obtain from the Radiologists Group a definition of the scope of its work

The Chairman informed the Conference that a suggestion had been received for the amalgamation of the Spa Practitioners Group and the Physical Medicine Group on the ground that hydrotherapy was a part of physical medicine The suggestion was opposed by several speakers including Dr Geoffrey Holmes who was one of those responsible for the formation of the Spa Practitioners Group Dr Holmes said that although it was true that hydrology was a branch of physical medicine, it had its own problems, and the majority of practitioners of physical medicine were not actively interested in hydrotherapy as practised at the spas Moreover it was necessary that there should be in existence a central medico political body which could speak on behalf of spa practitioners during negotiations with the British Spa Federation or when spa facilities for insured persons were under consideration When a vote was taken the proposal for amalgamation was defeated with one dissentient

The Conference then proceeded to appoint the Group Committee for 1936 7, and the voting resulted in the election of the following members Dr C W Buckley Dr R King Brown Dr C B Heald, Dr Harman Taylor Dr J B Mennell and Dr M B Ray It was suggested that it would be an advantage if the president for the time being of the Section of Physical Therapy of the Royal Society of Medicine were a member of the committee in addition to the six members permitted by the rules and the committee was instructed to seek from the Council of the Association standing permission to co opt the president

Status of Physical Medicine



The Assistant Medical Secretary read a letter from Dr W Kerr Russell who after apologizing for his inability to attend owing to illness submitted several matters which he thought might usefully be discussed by the Conference They included the question of terminology the status of physical medicine in relation to other branches of medicine the control of the sale and advertisement of electro medical apparatus and the charging of fees at hospitals and clinics Dr Heald agreed that all these were important questions particularly the improvement of the status of physical medicine but before they could hope for any substantial improvement they must have a name Various terms were at present in use to describe a practitioner of physical medicine but they were all cumbersome During a general discussion on the place of physical medicine in the diagnosis and treatment of disease several speakers gave their experience of the attitude of other branches of medicine to physical medicine Although the origin of physical medicine lay in orthopaedic surgery, and it was possible to call a practitioner of physical medicine an orthopaedic physician physical medicine had now become a separate entity and hospital departments of physical medicine now received cases not only from the orthopaedic department but from many other departments as well Yet it was still often regarded as inferior in status to the other main departments Dr Harman Taylor the head of the department of physical therapy of the Royal Southern Hospital Liverpool was able to tell a different story He said that his department had already reached the level of the teaching hospital class

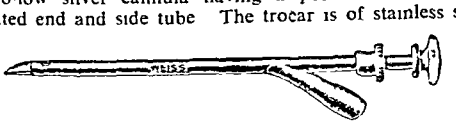
Preparations and Appliances

SWAB COUNTING BOARD

Mr CHARLES E KINDERSLEY F R C S (Bath), writes

The illustration below depicts a swab counting board which has been in use at the Royal United Hospital Bath for some years past. It consists of a sheet of stainless steel with holes to hold the swabs These holes can be cut to any required size shape and number according to the swabs used Round

holes are best. The main advantage is the ease of cleaning as compared with hook patterns which are a definite danger to the nursing staff It can be made either as a wall fitting on hooks from which it is easily removed the hooks projecting six inches from the wall a drip tray being fitted below or it can be made on a movable stand



The board is made by Messrs Allen and Hanburys Ltd

AN INTRAVENOUS TROCAR AND CANNULA

Mr REGINALD A KING F R C S (of the Surgical Unit St. Mary s Hospital London) writes

This design of trocar and cannula has been used by me for the past two years for the withdrawal of blood for transfusion and in certain cases for the administration of fluids by the intravenous route where continuous infusion is required

Transfusion Trocar and Cannula—The instrument consists of a hollow silver cannula having a polished lumen with fenestrated end and side tube The trocar is of stainless steel

and fits the cannula accurately When in the lumen of a vein the trocar is withdrawn to its full extent blood flowing via the side tube fitted with a convenient length of rubber tubing to a suitable container I have found the instrument simple to introduce into donors veins after the intradermal injection of 1 or 2 minims of weak novocain solution Having been introduced into a vein no further damage occurs to the intima when the trocar point has been withdrawn If clotting should occur in the cannula the obstruction can be overcome by one stroke of the trocar All the parts of the instrument are gold plated

Intravenous Trocar and Cannula—This instrument is of similar design but of finer bore and is used where fluids are given by the intravenous drip method for many hours or days The advantages of this design are that it is seldom necessary to cut down on a vein for its introduction no further damage occurs to the intima after the trocar is withdrawn and thrombosis is less likely to occur owing to the absence of ligatures Adhesive strapping fixes the cannula to the skin and absolute immobility of the limb is not essential

These instruments have been made by Messrs Weiss Oxford Street W 1

AN EMULSION OF IODIZED OIL FOR X-RAY EXAMINATION OF EMPYEMA CAVITIES

Mr WILFRID TRILLWOOD Ph C pharmacist to the City of London Hospital for Diseases of the Heart and Lungs writes

The application of emulsions of iodized oil for the x ray examination of empyema cavities was described by Mr Denis Browne in the *British Medical Journal* of November 3 1934 It appears however that no formula or details of preparation of such an emulsion have been published The clinical requirements indicated by Mr Denis Browne call for a cheap sterile stable and very fluid emulsion which furthermore must be of the type that will wet evenly the sides of the cavity without breaking into globules The oil then must be in the disperse phase and in this condition the emulsion may be diluted with water indefinitely without separation of the oil

Gum acacia is the obvious emulsifying agent for producing an emulsion of the oil in water type required It has however the serious disadvantage of being liable to heavy contamination with micro organisms and must therefore be sterilized before use Preliminary clinical trials were made with emulsions containing 5 10 and 20 per cent of the iodized oil representing iodine contents of 2 4 and 8 per cent respectively From a comparison of the skiagrams obtained the 20 per cent emulsion was found to give the most satisfactory results

FORMULA

Neo hydriol (May and Baker)	20 c cm
Sterile mucilage of acacia	30
Ti tree oil	1
Sterile distilled water sufficient to produce	100

The mucilage of acacia is prepared in accordance with the *B P* except that distilled water is used in place of chloroform water It is sterilized by heating in an autoclave for one hour at 110 C Considerable frothing occurs during the process and for this reason a securely plugged capacious flask must be employed Treated thus it appears that the emulsifying power of the mucilage is somewhat impaired and in consequence an inelegant product results unless an efficient homogenizer is used For the purpose a small hand homogenizer which may be autoclaved before use may be obtained for a few shillings The ti tree oil is mixed with the neo hydriol and successive portions of the mixed oils are added to the mucilage contained in a sterile mortar triturating well before each further addition The cream thus obtained is homogenized thoroughly a little sterile water being added to thin the cream if necessary The remainder of the sterile water is then added The product is a thin milky white emulsion which shows no sign of creaming or separation Chemical tests show that after keeping for four months in a white glass corked bottle exposed to light and frequently uncorked to allow access of air there is no trace of free iodine A sample similarly treated was found to be sterile on examination in the pathological laboratory

Emulsions prepared in a similar manner with neo hydriol viscous and *lipiodol descendant* give equally satisfactory clinical results but a downward creaming or separation occurs in a few hours which requires considerable agitation to *rediffuse* This tendency may be overcome by increasing the proportion of mucilage Alternatively the iodized oil may be diluted with a sterile fixed oil of low specific gravity and a correspondingly increased amount of mucilage used In either case a very much more viscous emulsion would result, and in the latter would produce a very viscous cream this would necessitate dilution with sterile water resulting in a final product containing less than the optimum 20 per cent. of iodized oil.

logists own fault Boards of management were usually ready to listen to suggestions put forward by the staff, and he thought that harm might be done if the boards found that their radiologist staff had approached the British Medical Association without first asking them to consider their proposals Other speakers agreed that the views of radiologists should have some means of expression in the management of hospitals and the committee was asked to consider the principle that in all hospitals the honorary staff should constitute a medical board to which all matters affecting any of the medical staff should be referred

Another matter affecting the status of radiologists which was referred to the committee for consideration was the principle that a copy of any memorandum referred to the secretary of a hospital should be given to the radiologist or other member of the staff concerned and that that member should always be given an opportunity of discussing the points raised Dr Cochrane Shanks asked if he might submit for the consideration of the committee a letter he had received concerning the charges to local authorities for the x-ray examination of cases for their orthopaedic services The meeting concluded with a vote of thanks to the chairman

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses gynaecology at Chelsea Hospital, February 8 to 20 medicine surgery, and gynaecology at Royal Waterloo Hospital, February 22 to March 6 children's diseases at Princess Elizabeth of York Hospital, February 20 and 21 Surgical tutorial classes especially intended for F R C S candidates are now being held at the National Temperance Hospital on Tuesdays and Thursdays at 8 30 p m Forthcoming classes are as follows January 26 Mr R C Brock Thorax January 28 Mr Hamilton Bailey, Testicle and Prostate February 2 Mr T Holmes Sellors Kidney and Bladder February 4, Mr A M Boyd Tongue Each class is self contained and separate lectures may be attended A course on anatomy and physiology in preparation for the Primary F R C S examination will be given at 5 15 p m on Mondays Wednesdays and Fridays at the Infants Hospital from February 22 to May 24 M R C P courses will be given as follows clinical and pathological National Temperance Hospital on Tuesdays and Thursdays at 8 p m February 16 to March 4 chest diseases at Brompton Hospital two evenings weekly at 5 p m February 22 to March 20 heart and lung diseases at Royal Chest Hospital Mondays Wednesdays and Fridays at 8 p m March 1 to 20 neurology at the West End Hospital for Nervous Diseases afternoons March 8 to 20

partly deaf persons and under industrial psychology a study of misfits in industry The report of the Ross Institute of Tropical Hygiene is incorporated in the school record, and gives an account of advice and assistance rendered to industrial and business undertakings in many parts of the world It is stated that the Institute is a centre to which industry over-seas looks increasingly for help on matters connected with the health of European staffs and labour forces in the Tropics and subtropics Finally, a list is given of over eighty papers or reports published during the year by members of the staff of the school

INHALATIONAL THERAPY FOR RESPIRATORY DISEASES

The popularity of operations on the nose and throat in the treatment of asthma has declined in recent years but there is still much enthusiasm for treatment aimed at correcting the morbid state of the respiratory tract The Dowling pack, the Proetz method of sinus drainage, and the inhalation of carbon dioxide all have their advocates as methods of relieving nasal congestion and infection The inhalation of adrenaline and essential oils, by means of a simple hand spray or with mechanical aids such as an oxygen cylinder or an electric motor is often successful in the paroxysms of asthma and in status asthmaticus and very good results are reported with the use of concentrated solutions of adrenaline from 1 to 10 per cent As attacks are often precipitated by protein particles such as moulds fungi, and animal and vegetable dusts in the atmosphere efforts have been made to filter and condition the inspired air, of which the most elaborate have been the allergen free cubicles of van Leeuwen

The Duke-Fingard treatment for diseases of the respiratory passages which has recently had a good deal of publicity in this country appears to be a combination of air-conditioning with the inhalation of medicated vapours in a hermetically sealed chamber[1] Courses of treatment are graduated, and starting with three hours, the patient may increase his stay in the chamber up to sixteen hours daily Considerable importance appears to be attached to Mr Fingard's formula, which consists in general terms of "phenol in combination with a carefully blended mixture of the essential oils aromatic substances iodine, creosote, and other coal tar derivatives" Any experiments which determined this particular blend of a great many variables are not described in the paper to which reference has been made The treatment is believed to remove catarrhal conditions and clear up infection of the bronchi, and successes are reported not only in asthma but also in tuberculosis and other respiratory diseases Voluntary financial contributions are now being sought to establish a grid system or network of clinics with Duke-Fingard chambers throughout the country

Any treatment which brings relief to the numerous sufferers from asthma and its distressing symptoms will have the support of the medical profession and we would not wish to damn this method with faint praise The reacquisition of confidence when the vital rhythm of respiration has been restored is of immense value in asthma, as shown by the successes of psychotherapy and respiratory exercises and if the sequence of attacks can be broken the patient is often well on the way to recovery It seems premature, however, to decide that the results obtained with the Duke Fingard treatment "appear to be permanent" or that the treatment is in any sense a cure The history of asthma and tuberculosis is a long record of premature publication and over optimism, and it is a pity that a treatment of this kind could not have been submitted for trial to the Asthma Research Council or the Therapeutic Trials Committee of the Medical Research Council with precise details of the formula before an appeal was made for public subscriptions

THE GEE-THAYSEN DISEASE

When Samuel Gee described a special form of chronic indigestion under the title of coeliac affection ' nearly fifty years ago he mentioned that it might be met with in persons of all ages Subsequent authors until recent years have stressed the occurrence of the disease in children but the late Dr H Thaysen of Copenhagen was insistent in his writings since 1929 that non tropical steatorrhoea in adults was essentially the same malady as coeliac disease in children A group of workers[1] in Dublin have recently reported in some detail ten cases of idiopathic steatorrhoea in patients between the ages of 19 and 63 and they suggest that the term "Gee Thaysen disease" should be used for this particular syndrome The characteristic voluminous pale fatty stools anaemias of various types tetany hypocalcaemia osteomalacia wasting and dwarfing abdominal distension changes in the skin and the lens and fractures are part of the complicated clinical picture in adults Certain diagnostic criteria set out by the Dublin workers include a low fasting blood sugar some increase in the basal metabolic rate evidence of abnormal calcium metabolism anaemia which may be hyperchromic or hypochromic gastro intestinal disturbances and increase of fat in the stools with normal fat splitting Of the ten cases reported three presented

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

DEATH

RONALD—On January 10 at Royal Hospital for Sick Children Edinburgh, John Michael Charles infant son of Dr and Mrs A Ronald 191 Abbey Road, Barrow-in Furness

this country to the equally fallacious view that all the ills of the community spring from malnutrition To the unbiased observer it is apparent that the health of the people could be greatly enhanced by an improved dietary The Newcastle report emphasizes again that two factors are responsible for deficient family dietaries among the less privileged classes—namely the economic factor and the lack of knowledge of what are the most valuable foodstuffs and how small means can best be expended The factor of ignorance is apparent in the extreme variations in the number of calories and amounts of protein and minerals consumed per man value —variations so great that as the report points out average figures for the groups have very little significance The low milk consumption per man value is another proof of the need for social education The economic factor might at first glance seem to be of less importance in that the difference between the employed and unemployed groups is not very striking but it is not apparent whether the employed group was in fact economically well provided for But looking closer into the difference between the employed and the unemployed groups we find that it applies to the more important foodstuffs, especially first class protein and calcium Moreover the report concludes that ' since the frequency distribution and the averages showed the unemployed diets to be consistently lower in every particular irrespective of housing conditions it is very probable that the diets of the unemployed as a whole were inferior to those of the employed " However hard may be the task of improving the economic circumstances of the general mass of the people there is little doubt that much can be done by social education to improve their dietary and to enable them to expend limited resources on the more valuable classes of food stuff The difficulties of influencing food habits have been well discussed by Aykroyd in his book *Vitamins and other Dietary Essentials* but that it can be done is clear from the many examples given by him and from the virtual disappearance of rickets from this country

A PORTRAIT OF SIR HENRY THOMPSON

Somewhere about 1870 the celebrated artist and beautiful woman Mrs Jopling painted a portrait of Sir Henry Thompson Sir John Millais portrait of the lady hangs in the Tate Gallery She lived to a great age 90 and Mr Lindsay M Jopling found the portrait in his mother s studio and generously sent it to the Royal College of Surgeons of England and they accepted it On hearing however that the picture would be welcomed in Sir Henry Thompson s old school University College Hospital Medical School the president Sir Cuthbert Wallace and his council graciously sanctioned its removal there on permanent loan The portrait, cleaned and repaired at the expense of Sir Buckston Browne now hangs in the staff-room at the end of the refectory of University College Medical School in University Street Gower Street Last week a little party welcomed the picture It included the Lady Palmer Dame Georgiana Buller Sir Herbert Thompson (son) Sir Thomas and Miss Barlow Sir Cuthbert Wallace and the dean of the school Mr Gwynne Williams The last named will be very happy if any wishing to see the portrait will call and ask the hall porter the way to the staff-room It is hardly necessary to remind our readers that Sir Henry Thompson (1820–1904) has two claims to remembrance He was professor of clinical surgery at University College London a pioneer in the surgery of the bladder and an ardent advocate for cremation in place of burial

MEDICINE IN THE GOLDFIELDS

Medical men never show to better advantage than when they are called on to practise their art under primitive and difficult conditions Medical practice can hardly have been more difficult or the opportunities for brilliant improvisation more numerous than during the Roaring Fifties the gold rush days in Victoria between 1850 and 1860 Gold was found in marvellous quantities in Bendigo and Ballarat all sorts and conditions of people British and foreign flocked to these remote places and the social commercial and political life of Victoria itself quite a recent growth was turned upside down Medical practitioners were among the earliest and most energetic pioneers Dr E A Mackay[1] gives a vivid and detailed account of how they practised their profession in the chaos which existed round the newly found seams Medical men he said were perhaps better able than other persons to accommodate themselves to the new conditions If a doctor s patients went to the diggings the doctor often followed All he needed was a horse and tent a leather case with a few instruments and some straightforward drugs such as laudanum and calomel he already had the nucleus of a practice and in his spare time he could do a little prospecting on his own account Naturally there was a great inrush of quacks who were a sore trial to the genuine practitioners Dr Mackay quotes from a book by a Mr William Kelly who visited Victoria twice in the 'fifties and had some amusing yarns to tell about what he saw some of which were reprinted in the *Lancet* of 1860 Delirium tremens was one of the conditions a knowledge of which a doctor found most useful Kelly stayed at a boarding house where the visitor could get a bad imitation of any drink he liked to order A doctor was practising in a space six feet by three feet canvassed off the public room it was his surgery laboratory and dormitory He slept on a central shelf and a narrow shelf above and the floor below were crowded with drugs bottles and appliances Prohibition was enacted fairly early in the days of the diggings with the result that every boarding house and shanty became a sly grog shop and the stock-in trade comprised some strange mixtures Though the really lucky diggers were supposed to order nothing but the best champagne no spree was regarded as complete until the trembling stage was reached The morning consultation would be crowded with battered looking men and women from the lock ups of the previous night demanding leeches and diachylon plaster Surgery was limited to unavoidable operations and the treatment of accidents Dysentery known as English cholera took a heavy toll because there were no

[1] *Med J Austral* September 26 1936

ichthyosis by small doses of thyroid taken regularly In others it is less successful, but the remedy is worth persevering with Claims have also been made for thyroid extract in psoriasis, but the evidence of a beneficial action here is not so clear In other skin conditions indications for thyroid extract are less definite

The improved cerebration of the myxoedematous patient under treatment has led to the employment of thyroid in certain mental disorders, especially those associated with dullness or depression, and good results are often obtained in such cases

Another interesting and little-known use for thyroid extract is in the chronic oedemas of renal disease Some diuresis is commonly observed in myxoedema and other cases under treatment with thyroid extract, which has been strongly recommended for the persistent oedema of the nephrotic syndrome, and it may be of definite assistance It is interesting to note that this class of patient can tolerate relatively large doses of the drug without inconvenience

Formerly the extract was employed in diseases of the thyroid gland itself, but such treatment is especially dangerous, for overaction may be very easily induced When subthyroidism develops in a case of goitre, thyroid extract is of course indicated Other uses are less easily explained and may be entirely empirical It has been prescribed in those chronic disorders in which potassium iodide is given—arteriosclerosis, fibrositis, chronic rheumatism, etc—probably with the idea of stimulating local metabolic changes and increasing the removal of waste products Thyroid extract has been put forward as a means of preventing the development of eclampsia, and in the fully developed case enormous doses have been taken The list of diseases for which it has been recommended might be indefinitely extended, but this would serve no useful purpose

Method of Administration

The secretion of the thyroid gland is a very powerful agent, and serious harm may result if its action is not carefully controlled In no circumstances should the drug be left to a patient to take freely Treatment must be closely supervised by the medical attendant, and the patient should be seen at least once a week The dangers are the development of hyperthyroidism and in particular cardiac symptoms, and the risk is increased by the fact that these may appear slowly A point of great importance is that the full effects of the drug are not seen for several days after it has been begun or the dose has been increased This fact is in keeping with other metabolic phenomena For example, an increase or reduction of protein or of carbohydrate in the diet does not exert its full effect on metabolism for about four days The results of administering thyroid extract can be readily followed in an obese patient who is weighed daily The influence on the weight is seldom noticed before the third or fourth day and the maximum increase in pulse rate does not occur for some time longer The full increase in the basal metabolic rate is also slow in developing For this reason it is a good rule not to order an increase in the amount of the drug at intervals of less than a week Further, it is impossible to foretell exactly how much thyroid an individual will require or how much he will be able to tolerate In all cases, therefore the initial dosage should be small Obese subjects are especially intolerant of the drug, and for them the initial dose should not exceed half a grain twice or three times a day Other patients may begin with double this amount Owing to the very slow development of the action there is no reason why the daily quantity prescribed should not be given in a single dose, but the practice of taking medicine three times a day is firmly established in the lay mind If the drug is to be taken for a prolonged period it is often advised that it be discontinued for a few days each month so as to lessen the possibility of overaction developing

Small doses are often adequate for certain purposes, but in other cases it is often desirable to push the drug to the limit of tolerance in order to get its maximum effect In these circumstances signs of overaction must be constantly looked for The earliest evidences of intoxication vary in different patients Some complain of palpitation tremor nervousness or headache when taking only small amounts Patients with fatty hearts are particularly prone to develop cardiac symptoms and the possibility of auricular fibrillation must be kept in mind The drug must be reduced or discontinued at once if any symptoms appear The physician's best guide for controlling cases under thyroid treatment is the rate of the pulse It is usually perfectly safe to continue administration so long as the pulse rate remains under 100 beats per minute Obese patients who are otherwise in good health will often tolerate 6 to 9 grains of thyroid (*B P*) daily, and I have given for a time as much as 18 grains to a woman of 30 who weighed 28 st Patients with the nephrotic syndrome are especially tolerant to thyroid, and can continue relatively large doses with impunity

The doses mentioned above are in terms of thyroid *B P* (thyroid extract) and this is probably the best preparation for general use Thyroxine has no special advantage except that it can be given intravenously and may come into action more rapidly, There are also on the market other preparations of thyroid substance for which special claims are made such is being less liable to upset the heart than the official preparation With these as with the standard drug the most suitable dose has to be determined by the method of trial and error

BRITISH EMPIRE CANCER CAMPAIGN

In the absence of Viscount Hailsham Sir Cuthbert Wallace, President of the Royal College of Surgeons of England, presided at the sixty-first quarterly meeting of the Grand Council of the British Empire Cancer Campaign held at 12, Grosvenor Crescent on January 11

The Council was informed that Viscount Hailsham had sent a letter to the King tendering loyal and humble thanks for the services which His Majesty had rendered the cause of cancer research as the president of the Campaign since 1924 to the time of his accession to the throne A message in reply from His Majesty was read

The Council tendered its sympathy to Lady Bland Sutton in her recent bereavement The late Sir John Bland Sutton was one of the founders of the Campaign and was vice chairman of the Grand Council for ten years Mr Stanford Cade F R C S of the Westminster Hospital, was invited to become a member of the Grand Council, and Sir Harold Mackintosh, Bt, and Mr B T Clegg were also invited to become members to represent the Yorkshire Council in addition to the Earl of Harewood

The following grants in addition to those totalling £28,995 which were made at the annual meeting in November were approved on the recommendation of the Scientific Advisory Committee £200 to cover the cost of special physical investigations being carried out under the direction of Dr F G Spear at the Strangeways Research Laboratory, Cambridge £500 for one year to Dr H J Phelps, whilst carrying out experiments in connexion with Dr Lumsden's anti cancer serum under the supervision of Dr Gye and Professor McIntosh, and £440 for one year to Miss C F Fischmann, working in the Bernhard Baron Institute of Pathology at the London Hospital

NOTES OF THE WEEK

Hospital Co operation

Liverpool and Newcastle are following Manchester and Oxford in the establishment of permanent machinery for the purpose of co operation between the voluntary and municipal hospitals In May 1936 an Associated Voluntary Hospitals Board was formed in Liverpool to represent the voluntary hospitals in the area and to consult with the Hospitals Committee of the Liverpool City Council Conferences between the two bodies led to the appointment of a small committee representing both the municipal and the voluntary hospitals and this committee is now to be replaced by the new permanent Joint Committee The Joint Committee is to consist of sixteen members of whom six will be appointed by the Port Sanitary and Hospitals Committee of the City of Liverpool six by the associated voluntary hospitals and three by the University of Liverpool The medical officer of health will also be a member The function of the Joint Committee will be to promote the best possible utilization of all available hospital facilities with a view to the development of an efficient unified service for the whole area Its business will include the provision and extension of accommodation and equipment medical and surgical staffing medical education and research financial questions and any other matters of common interest to voluntary and municipal hospitals

The Newcastle upon Tyne City Council has just approved a scheme for a Joint Hospitals Advisory Board The scheme is the result of a review of general hospital accommodation in the area prepared by the Health Committee for submission to the Royal Commission on Tyneside Local Government Further consideration has convinced the committee that the hospital needs of the city and surrounding areas cannot be met either adequately or economically without a greater measure of co operation and co ordination than exists at present The new Joint Board will be representative of the municipal hospitals the voluntary hospitals and the College of Medicine and its functions will be to consider the relation between hospital needs and the existing provision and to promote co operation and co ordination between the voluntary and municipal hospitals

Rehabilitation Centres

Industrial Welfare publishes an account of the New Rehabilitation Centres organized by the Imperial Chemical Company which employs about 60 [illegible] factories in seven counties [illegible] addition to an ambulance room [illegible] central surgeries which are staffed by State registered male nurses and are equipped to deal with all emergencies As an experiment simple electrotherapeutic apparatus has been installed at one of these central surgeries and a male nurse who is qualified to give massage and electrical treatment has been added to the staff The centre is now able to give intensive courses of treatment for fracture strains and other injuries shortening the period of disablement and its value has already been demonstrated by the fact that although previously the accident severity rate of this centre's area exceeded the rate in the other surgery areas it is now below it The centre co operates closely with the local doctors who are usually willing to send patients to the centre or to allow them to be visited by the nurse in charge

Gloucestershire Infirmary

The Gloucestershire Royal Infirmary has adopted the income limit recommended by the British Medical Association Free treatment will in future be available only to persons with incomes below the following limits

Single persons widows and widowers without children	£200
Married persons without children or persons with one dependant	£2 0
Married persons with a child or children under 16 or persons with more than one dependant	£ 0

Persons whose incomes are above the limit of £500 will be able to obtain treatment in the [illegible] of the Infirmary

Lieut Colonel J C Davie M D J P T D has been elected chairman of the Denbighshire Insurance Committee for 1937

Dr J Braithwaite has retired after thirty years practice in Boston, Lincolnshire

the year, providing experience which will be useful when larger mass units become available The follow-up of patients is efficient, with less than 1 per cent of cases untraced

Of the two Glasgow centres that at the Western Infirmary shows a close liaison between the x-ray and radium departments, and a common basis for dosage measurements in roentgens has been found possible At the Glasgow Royal Infirmary a new deep x-ray set has been provided Despite the large area served by this centre, there is no waiting list among cancer patients, follow-up measures are organized so successfully that no case remained untraced The Leeds centre has a one gramme unit working twenty-four hours per day in three shifts of eight hours There is at present no provision of "pay-beds" in the Infirmary, but it is expected that these will be available when the building of the new hospital is completed in some three years' time At the Liverpool centre further developments await the proposed reorganization of hospital services in the city The Manchester centre continues to discharge the admirable function of training radium therapists and radium officers, who in due course disseminate modern methods elsewhere Pending the provision of a radium beam experience is being gained in the employment of special "radium collars The radium collar is also in use at the Mount Vernon Hospital, London, which, like Manchester, fulfils the role of a school of radiotherapy At the Newcastle centre, where for various reasons difficulties have been encountered in the past, the number of patients receiving radiation treatment is increasing There is a waiting list among cancer patients on account of scarcity of beds Treatment under the auspices of the Sheffield centre is carried out in five different hospitals, an arrangement tending to produce administrative difficulties Some merging of hospital activities in the city is predicted in the near future, a step which should facilitate the work of the centre

Reports follow describing progress in the regional radium centres at Lincoln, Norwich, Plymouth, Southampton, and Stoke-on-Trent, and in the "recognized" hospitals at Bradford, Burnley, Leicester, and Wolverhampton

Radium Beam Therapy

The value of radium in large units for the treatment of certain classes of cancer is a question to which the Commission has devoted much attention The Commission has been unable to provide for the setting up of a unit larger than one gramme in any of the centres Apart from the restricted stock of radium at its disposal the employment of mass radium demands specially trained personnel and special equipment The Radium Beam Therapy Research has, however, been employing three five-gramme units in an investigation of the value of beam therapy in cancer of the mouth, pharynx, and larynx It is hoped that the results of this investigation will provide useful data for the guidance of the Commission in its future policy

Several factors point to the need for increasing the available supply of radium An extension of the work of the present centres is envisaged, and the establishment of new centres is also desirable Further, there is an increasing tendency to replace the interstitial and intracavitary use of small quantities of radium by the external application of large quantities at a distance The number of patients who can be treated by a mass unit in the course of a year is comparatively small, an increase in the number of mass units is therefore required

A Statistical Survey

The Report concludes with an appendix of more than forty pages "a Statistical Report of the Results of Radium Therapy in the Treatment of Cancer of Certain Sites at Hospitals associated with the Commission" In this appendix separate chapters are devoted to carcinoma of the breast, the cervix uteri, the lip, the tongue, and the floor of the mouth The survey is based upon an analysis of the records of more than 5,600 patients, drawn from hospitals distributed throughout the whole country The assessment of the value of different methods of treatment by the use of survival rates is a matter of the greatest difficulty on account of the large number of different therapeutic combinations employed In treatment of carcinoma of the breast eighty six such combinations were distinguished Among the inferences drawn from the survey, which covers the whole of the years 1930, 1931, 1932, the following may be cited Patients suffering from carcinoma of the lip, tongue, and cervix uteri showed an increasing tendency to come early for radium treatment Patients with the highest survival rate in each stage of the disease were those for whom a histological diagnosis was made In treatment of carcinoma of the cervix the employment of deep x ray therapy increased, while the practice of interstitial needling of the cervix diminished, in carcinoma of the breast surface irradiation was more extensively used Patients with carcinoma of the cervix of the age of 50 years or over showed a higher survival rate than those under 50, this difference being especially marked in the more advanced stages of the disease

RESEARCH IN LUNACY AND MENTAL DEFICIENCY

The second part of the twenty-second annual report of the Board of Control, covering the year 1935, comprises a summary of clinical and scientific investigations completed and in progress in mental hospitals and kindred institutions in England and Wales entries recorded by commissioners at these establishments, and lists of approved hospitals and nursing homes where persons suffering from mental disorders and deficiencies can be accommodated It opens with a supplement on research and other scientific work in the year under review, and notes are incorporated on the various researches at different centres Some idea is thus given of the various directions of clinical and experimental study at present, and references are also made to publications by members of the staffs in professional journals during 1935 The following notes illustrate the wide field in which research is continuing

The Brain and Mental Disorder

At Stoke Park Colony, Stapleton Bristol an examination was undertaken of the brains of fifty-five deceased defectives and the findings were compared with those in twenty-eight normal cases In this series the proportion of brain size of defectives to normals was 76 to 100 suggesting that most defectives were so because their brains were too small The fact that this estimate includes defective brains pathologically enlarged by hydrocephalus, tuberous sclerosis, excessive gliosis, and similar conditions heightens the probability that in the great bulk of defectives the brain is only two thirds the normal size It is pointed out that the size of the brain can be deduced from that of the head, and that therefore a scientific separation can be made between the "educable" and "ineducable" defectives with a corresponding diversion of labour into the more profitable channels In none of the defective brains was the general appearance normal structural peculiarities noted included microgyria frequently and porencephaly twice, exposed insula in many, absence of the corpus callosum once, hydrocephalus three times imperfect development of the opercula, abnormal presence of the anthropoid lunate sulcus, divided central sulcus (an extremely rare developmental error), tuberous sclerosis lobar sclerosis, and in most cases a gross irregularity of the cerebral sulci and convolutions Whereas in normal brains the relative proportions of precentral (effector) and post central (receptor) areas was 38 7 to 100 in the defectives it was only 37 5 to 100, and it is believed that this phenomenon

National Eye Service

Another occasion when the authority of the Association was sufficient to disappoint the claims of applicants for official recognition was the promotion of the Optical Practitioners Registration Bill in 1927. This Bill was submitted for consideration to a Departmental Committee to which the Association was asked to give evidence. The committee did not completely reject the opticians' claims but it decided to leave the matter open after the Association's witnesses had given an undertaking that within a reasonable time the medical profession would show that it could itself provide an adequate ophthalmic service with moderate charges for insured persons and persons of similar economic status. The Association accepted the challenge and the result is the National Eye Service which provided that it receives the continuous support of general practitioners should offer a sufficient reply to any future demands of sight testing opticians for official recognition.

(To be concluded)

PROBLEMS IN PRACTICE

(These columns are devoted to matters of general interest on which individual members have sought the advice of the Head Office of the British Medical Association)

The Coroner and Coroners' Inquests

The Coroners Act of 1887 requires that where there is reasonable cause to suspect that a person has died either a violent or unnatural death or has died a sudden death of which the cause is unknown an inquest must be held. When a medical practitioner becomes aware of such a death he should notify the coroner without delay and in addition give a certificate to the registrar of births and deaths. He is not directly under a legal duty to do this but the better the relations which subsist between the practitioners of a district and the coroner the happier for all concerned.

Cases of sudden death sometimes occur which leave the practitioner in doubt whether he can or cannot properly certify the causes of death. For example he may know that the deceased was subject to some disease likely to cause sudden death, say aortic regurgitation or thoracic aneurysm, but he may not have seen the deceased for perhaps weeks or months before the fatal event. The duty of the practitioner in these or other circumstances where a doubt exists is to give a medical certificate of the cause of death to the best of his knowledge and belief and to report the case to the coroner. In the end it always rests with the coroner to say whether the case is one in which an inquest is necessary. If the coroner wishes for further information before deciding to hold an inquest he may send his officer to question the practitioner. There is no obligation upon the practitioner to answer these questions and if he chooses he is quite within his right in refusing to give information until he is on oath in the witness box.

When a coroner proposes to hold an inquest he may summon the practitioner as a witness. If the deceased was not attended by a practitioner the coroner can summon any practitioner in practice near by to give evidence as to how the deceased came to his death. He can also either in his summons or at any later time until the inquest direct the practitioner to make a post mortem examination. Similarly if the coroner thinks that a post mortem examination might make an inquest unnecessary he can direct any practitioner whom he could summon as a medical witness to make such examination and report in writing. The practitioner must obey the summons. Moreover, at any time after he has decided to hold an inquest the coroner may request any practitioner to make a post mortem examination or do a special analysis or test or make any other examination which the coroner thinks ought to be made. The practitioner need not comply with the request but if he does and is summoned as a witness he may be asked his opinion on any matter arising out of the examination and on the cause of death. If the coroner thinks that a necropsy will make an inquest unnecessary he may request any practitioner whom he could *not* summon as a witness to carry it out and the doctor may consent or not as he pleases.

The general practitioner will do well not to forget that he may at any moment find himself called upon to perform a necropsy and make a report. If he is new to the work he should read what Taylor and other well known writers on medical jurisprudence have to say about it. He will of course use the greatest care in performing the examination and in writing his report, bearing in mind the possibility that he may have to undergo cross-examination at the inquest by counsel instructed to support some contradictory view on the cause of death. He should use clear simple language and write nothing which he is not prepared to stand by in public. The coroner calls witnesses by written summons but in practice this is often dispensed with and the coroner's officer—who is often a policeman—merely calls on the doctor and informs him or his servant that he will be required to give evidence at a certain time and place. Though in strict law this does not constitute a summons which the practitioner need obey he should treat it as a legal summons for the sake of maintaining a proper relationship with the coroner and so with the public interest. The system is inherently bad and always very imperfect and—especially where the coroner is not medical—occasions of friction often arise. The practitioner should therefore exercise great tact in all his dealings with the coroner and if he gets into difficulties consult the secretary of his Division or the Central Office of the Association.

INSURANCE MEDICAL SERVICE WEEK BY WEEK

Physical Examination of a Patient

A doctor must in the first instance be the judge as to the extent to which a physical examination of a patient is necessary, especially on the first occasion, and the patient is not entitled to be in possession of such information as to the condition of the patient as the patient himself possesses (in the form of symptoms with which the patient is himself familiar). It would be unreasonable to expect a doctor to make a physical examination of every patient who enters his surgery unless he is given some indication that such an examination is either desirable or necessary, particularly in a case in which a patient gives no indication of symptoms which in the doctor's opinion render a physical examination necessary.

This view finds expression in the report of a Medical Service Subcommittee which also points out that before making a complaint of negligence against a practitioner there is an onus on an insured person or his relative to give that practitioner a fair opportunity of making an examination before they obtain the services of another doctor. There may be cases in which, despite the absence of a specific request for an examination, a patient may be justified in seeking other advice. The report proceeds:

In the present case there seems to have been nothing which would have prevented the practitioner being made acquainted as was the second doctor with the true condition of the patient and of the consequent necessity for a physical examination.

TREATMENT OF CARDIAC ISCHAEMIA

COLLEGE OF SURGEONS LECTURE ON FIRST RESULTS OF CARDIO-OMENTOPLAY

A special lecture was delivered at the Royal College of Surgeons of England on January 15 by Mr Laurence O'Shaughnessy on the treatment of cardiac ischaemia, in which, after first dealing with experimental methods of initiating and supplementing reparative processes in *coronary thrombosis and coronary sclerosis* by the provision of an additional blood supply to the heart through grafts of living tissue, he described the operative technique and the case records of the first patients to be treated by cardio-omentopexy Sir Cuthbert Wallace presided, and the large audience included most of the members of the Council of the College

Viscount Dawson's Address

VISCOUNT DAWSON who gave a short introductory address, said that it so happened that he was the head of a small cardiovascular clinic established at Lambeth Hospital by the London County Council on the advice of Sir Frederick Menzies The clinic had been equipped under the direction of the hospital superintendent, Dr P J Watkin, and had the services of Dr H E Mansell of Lambeth Hospital, Dr Daniel Davies of the Royal Free, and himself, and the staff had co-operated with Mr O'Shaughnessy in the excellent surgical work he was doing in the field of cardiovascular disease It was only natural to suppose that a muscle which was unceasingly active from birth to death should need a big supply of blood if it was to be equal to the large amount of energy demanded, moreover, provision must be made for great changes in the requirements of blood and sensitiveness to deficiencies thereof The anatomists calculated that during exercise the coronary arteries put out 1·4 litres per minute, representing a volume three times the size of the heart itself As for quality, a fall of 50 per cent in oxygen saturation of the blood would require the coronary flow to be increased fourfold by way of compensation The findings of pathology accorded with these conclusions Absence of nourishment of the heart, whether the result of a diminution in quantity on account of arteriosclerosis of the coronary tree, or of a diminution in quality by reason of lessened oxygen content, gave precisely the expected changes in the myocardium Where occlusion was not immediately destructive of life the problem was to secure an adequate compensatory circulation The difficulty was not in the anastomosis, but arose from the great vascular needs of the active heart It was known that pericardial adhesions formed a most effective collateral circulation Lord Dawson mentioned the work of experimentalists and clinicians on this and cognate points In one reported case it was shown at necropsy that there had been complete occlusion of each *coronary* artery for a considerable time, and yet there had been no clinical history of any attack of coronary thrombosis, the pericardial adhesions had actually been supplying the heart Such a compensatory circulation through the pericardium might sometimes form by itself, but if it did not, then surgical measures to establish it constituted a reasonable procedure The prospect should be good in selected cases provided the capillary bed itself was not too degenerate to profit by the new arterial supply Mr O'Shaughnessy had acquired a high degree of skill in this field of constructive surgery

Experimental Cardiac Grafting

Mr O'SHAUGHNESSY, after referring to the ingenious methods employed by various workers to produce cardiac ischaemia in the heart of the experimental animal, and in particular the results recently published by C S Beck and V L Tichy in America of an experiment in which they had fashioned grafts from the pericardium, the omentum, and the chest wall, and put them on to the heart, said that his own experiments in cardiac grafting began at the research farm at Downe in 1933 In a previous paper, published in January of last year, he had described the first results of a series of grafts in the cat and more particularly in the greyhound, showing that the presence of such a graft was compatible with the highest degree of physical exertion—in the case of the greyhound, of pursuing the electric hare with undiminished vigour The greyhound was eventually killed to demonstrate that the anastomosis got better with time, and not worse

The omentum was the only structure in the body with the specific property of vascularization The practical importance of that fact was appreciated many years ago by Rutherford Morison The operation of omentopexy had proved a good therapeutic measure in alcoholic cirrhosis, and Professor Grey Turner had given him notes of a case operated on thirty years ago, and the patient was still living Even if it was agreed that omentopexy could not cure cirrhosis, the essential theoretical basis for cardio-omentopexy remained unshaken Sir David Wilkie's early and complete experiments on the omentum gave an initial impetus to its use in surgery of the chest. Wilkie showed how in the cat the omentum could avert the diseases which normally followed ligature of all the vessels to the spleen If the omentum could compensate for acute ischaemia in its natural media, there was no reason why it should not fulfil a similar function once it was given access to the thoracic cage

The lecturer showed in successive drawings the technique of the operation whereby the omentum was brought up through an opening in the diaphragm, the myocardium opened and prepared for the reception of the graft and the graft sutured to the surface of the heart He also illustrated the results of one animal experiment which had been carried out with a view to putting a diaphragm graft on the heart The animal was killed a month or two later and the diaphragm graft could not be seen, all that could be seen was the omentum filling the left chest A small opening had been left in the diaphragm, and the omentum had come forward to close that opening which was its natural function, and had invaded the thoracic cavity

Collaboration of the Physician

The school of thoracic surgery to which the lecturer belonged had always held that major interventions in the chest were only justifiable when there was close collaboration between physician and surgeon It was not enough for the physician to refer a case, he must be in close contact with the patient in the immediate pre-operative period, and he and the surgeon must share the conduct of the post-operative period Recent developments of radiological and other special methods had done nothing to invalidate that principle, which was naturally of very special importance before operation was contemplated on the human heart Although the operation he described was devised in the College laboratory and its technique had been modified according to purely surgical contingencies, its actual performance had only taken place after the most careful consultation with the medical staff of the Lambeth clinic In addition, the suitability of each

The staff received the same amounts from the contributory scheme as the staffs of other departments and they were represented in the management of the hospital

The Chairman said that the profession should recognize the fact that every branch of medicine had some connexion with physical medicine which was playing an increasingly important part in the diagnosis and treatment of disease He believed that it was at least as important for a general practitioner to know how when and why massage or electrotherapy should be given as it was for him to be able to recognize a digitalis leaf The duty of the group was to endeavour to enable physical medicine to take its proper place in the general practice of medicine and surgery A practitioner of physical medicine should not be regarded as one whose competence was confined to the use of a faradic battery

Dr Cumberbatch believed that the only way to improve the status of physical medicine was to establish a diploma He said that 7 700 members of the Chartered Society of Massage and Medical Gymnastics were licensed to practise branches of physical medicine and there were many uncertificated persons who were also practising it and who were not subject to the same restrictions as the members of the Chartered Society It the profession wished to prevent physical medicine from falling entirely into the hands of persons without a full medical training young medical men of the right type must be attracted to the practice of physical medicine In order to achieve this the institution of a diploma seemed to Dr Cumberbatch absolutely necessary Sir Robert Stanton Woods said that the Royal College of Physicians had not shelved consideration of the question of awarding a diploma The Committee was asked to consider what further action could be taken on this subject

Control of Advertisements

Several members spoke in favour of the establishment of some form of control of the advertisement and sale of electrotherapeutic apparatus such as had been introduced in the United States by the American Council of Physical Therapy Dr Beaumont suggested that no special machinery would be necessary if practitioners of physical medicine were encouraged to use only such apparatus as was employed by teaching hospitals the Chartered Society or physicists of repute The Committee was eventually asked to consider the matter and to formulate a scheme of policy for submission to the next Conference The Conference also referred to the Committee the question of fees charged at hospitals and clinics to patients who were in a position to pay for their treatment

At the conclusion of the meeting Sir Robert Stanton Woods referred to Dr Heald's motion at the last Conference proposing that the Group should commit suicide Sir Robert said that the only way in which any branch of medicine could be rescued from obloquy was by the determination of each individual to raise his own standard of practice He hoped that the Committee would consider in all seriousness the value to the profession of the continuance of the Group

A vote of thanks to the chairman was passed and Dr Buckley in reply said that the present meeting was the best attended and most vociferous that had yet been held and a number of members who had apologized for their inability to attend had sent expressions of their views on the matters on the agenda The Conference had given the Committee a great deal of work and the coming year should demonstrate that the continuance of the Group was fully justified

RADIOLOGISTS GROUP

The newly formed Radiologists Group held its first meeting at B M A House Tavistock Square on January 15th Thirty members were present and Dr F Reynolds was elected chairman A Group Committee consisting of the following members was elected for 1936–7 Dr R Boulton Myles Dr R J Reynolds Dr C G Teall, Dr E W Twining Dr J D White Dr E R Williams

Radiologists' Reports

The Group discussed several matters which affected the status of radiologist members of hospital staffs Dr Boulton Myles referred to the procedure adopted in the preparation of reports for the purposes of legal cases and that when a legal issue arose out of a case which had been admitted to hospital in the past and had received an x-ray examination the radiologist in charge of the case usually obtained a report from the radiologist but the radiologist himself was not consulted in any way This seemed to him a wrong procedure for very often the whole case turned on the radiographs and the radiologist's report Dr Myles thought that the Group Committee might be able to obtain information on the question from a number of hospitals and do something to encourage the recognition of radiologists in the preparation of reports in legal cases for the hospitals probably did not understand the injustice they were causing Dr [illegible] said that in his hospital there was a rule [illegible] board that no hospital reports should be used for purposes of litigation the were even [illegible] hospital records The rule had removed the difficulties which Dr Myles referred Dr Teall said that so long as a patient was an in patient the resident staff might use any available information for the preparation of a report but radiographs should not be sent out of the hospital for any purpose Dr Malpas said that in his experience discharged hospital patients [illegible] hospital for x-ray examination [illegible] companies He considered that such cases should be referred to the hospitals privately and that the insurance company should pay for the examination The meeting eventually decided to ask the Group Committee to consider the whole question

Pay beds and Private Practice

Dr Brailsford read a letter from a radiologist whose private practice had been seriously affected by the radiological work performed in the recently opened paying patients block at the local hospital Payment for x-ray examinations made at the hospital was included in the weekly maintenance charge and the practitioner concerned who was a radiologist member of the staff was paid at a flat rate for each examination He now found that much work which normally would have come to him as private work was now being transferred to the hospital paying block and he asked whether something could not be done to ensure that the fee charged to paying patients could be so arranged that the radiologist would receive a fair remuneration for his work Dr D [illegible] White related his experience in connexion with work for paying patients and he said that lay boards of management assessed the maintenance charges without taking into consideration the work of the radiological and pathological departments This seemed to him to be a matter which the Group Committee might usefully discuss with the Pathologists Group Committee Dr Teall expressed the opinion that the situation was largely due to the radio

Reports of Societies

MALIGNANT BONE TUMOURS

At a meeting of the Section of Radiology of the Royal Society of Medicine on January 15, with Dr N S FINZI presiding, the subject for discussion was malignant bone tumours

Dr JAMES BRAILSFORD said that there were three lines of investigation of bone tumours—namely, the clinical, the histological, and the radiological and a case in which any one of these had been neglected had not received adequate attention In some cases only by a careful correlation of the findings of experienced observers in these three spheres would it be possible to arrive at an accurate diagnosis of the nature of the tumour In other cases positive evidence would be obtained from either the clinical history, or the histology, or the radiology, the other methods supplying negative or even conflicting evidence The positive evidence must always be allowed to dominate the ultimate conclusion Radiography was the first court of appeal after the clinical examination, for it would often supply evidence of the nature of the lesion without undue delay or discomfort to the patient Interpretation of the radiographs should not be attempted without a thorough knowledge of the clinical history of the lesion, for radiographic appearances, like clinical ones, could be similar in widely different conditions

Radiological Features

The radiographic features were influenced by the nature of the tumour cells, the reaction of the adjacent normal tissue, the rapidity of the growth, the function and immobilization of the part, the presence of infection, and the exhibition of therapeutic measures, particularly radiation Sarcomata and endotheliomata were the principal malignant tumours of bone but malignant metaplasia was seen in certain simple tumours, traumatic lesions, chronic inflammatory lesions, and such conditions as osteitis deformans The radiographic features of these tumours were simulated by carcinomatous deposits in bone, and must be distinguished from them A classification based on the histological or fully developed clinical and radiological picture would not materially assist in the early diagnosis of malignant bone tumours Such tumours in the early stage might produce either no change in the radiographic appearances of the affected bones but only perhaps some alteration in the appearance of the adjacent soft tissue, or an area of osteoporosis, or osteosclerosis with or without a periosteal reaction, or a diffuse change in the cancellous structure The recognition of these slight changes would permit a suspicion of early malignancy, and it was probably only when this early detection brought prompt surgical measures that effective treatment was secured In some cases the early radiographic features were characteristic even before the clinical findings warranted so serious a diagnosis and while the histological picture was still indefinite

Early amputation of the affected limb appeared to offer the best chance of cure Radiation therapy should certainly not be applied until a careful radiographic record had been obtained and the nature of the tumour determined, as it might mask the malignant nature of the lesion, and by staying the hand of the surgeon rob the patient of the chance of recovery Radiation might somewhat delay the development of the tumour, but it did not stop the development of distant metastases and therefore could not be said to effect a cure Even in the so-called simple tumour of bone the growth of which might be checked or abolished by radiation there remained abnormal tissue at the site in which subsequent malignant metaplasia might occur The reconsolidation of bone at the site of a localized carcinomatous metastasis following radiation therapy was probably the best palliative result of such radiation

Osteogenic Sarcoma

Mr W H OGILVIE confined his remarks to osteogenic sarcoma, by far the most important group numerically, accounting for more than 50 per cent of bone tumours reported to the American Registry Compared with malignant disease elsewhere it was appallingly fatal In microscopical appearance there was great variation, for the growth derived from cells whose function it was to form bone that function being exercised in varying degrees Thus in osteogenic sarcoma there was a destruction of bone by tumour and new bone being laid down, in part by the effort of the malignant cells and in part by the effort of the periosteum to repair the damage He was doubtful whether the division of these tumours into several subgroups, as was done by American writers, had any real pathological basis or clinical value Osteogenic sarcoma presented a reasonably clear clinical picture He discussed the cardinal diagnostic points The great majority of these tumours occurred between the ages of 5 and 20 The patient was nearly always in excellent health at the time of onset Pain was constant, early, and often the first symptom The rate of growth was steady, noticeable from month to month, but not over shorter periods, contrasting with the slow growth of benign tumours and the rapid growth of inflammatory lesions Nearly half the tumours appeared in the femur and a quarter in the tibia Definite signs of inflammation were generally against a diagnosis of osteogenic sarcoma Radiological observation was the first court of appeal but clinical observations which should be made in a doubtful case included a Wassermann test, a careful examination of the blood the taking of the rectal temperature, attention to any site of local sepsis and a trial of therapeutic irradiation which, though without curative effect, relieved pain and caused shrinkage in size The outlook was not quite so black as was sometimes supposed, he quoted from literature figures showing a five year cure rate of 10 per cent, following treatment by amputation or local resection

Classification and Nomenclature

Dr R W SCARFF pleaded for a better co ordination of nomenclature Classification and nomenclature did not of themselves constitute knowledge, but it was essential that all the workers concerned should be discussing the same entity He mentioned Ewing's tumour, on the separate existence of which some doubt had been cast There was no unanimity about it although Ewing first described it sixteen years ago The speaker thought it a distinct entity, but one which might be simulated both clinically and radiologically by other conditions Dr J DUNCAN WHITE showed radiographs of a doubtful case alike in its clinical, radiological, and histological aspect, the doubt being as between a chronic inflammatory process and a sarcoma Dr J E A LYNHAM drew attention to the spicular or palisade appearance along the bones as seen in the radiographic picture In his experience this was associated with chronic inflammatory disease, except in one case, which was a periosteal sarcoma of the tibia The question of a biopsy had been mentioned, and objection had been raised as it was thought the taking of a section might encourage metastases But the majority of patients died from metastases irrespective of whether a section had been taken or not and the early taking of a section might lead to earlier amputation, with some prospect of cure Mr HOPE CARLTON called attention to the vagueness of the whole subject, and pleaded for dogmatism even at the expense of a certain amount of accuracy Dr GEORGE SIMON asked certain questions as to classification

Dr FINZI from the chair, said that it was obvious that a satisfactory classification based on the pathology of the

Alteration of Area of the Durham, Gateshead, Consett, and Newcastle-on-Tyne Divisions

With reference to the preliminary notice as to the above given in the *Supplement* of November 21 1936 notice is hereby given by the Council of the Association to all concerned that as from the date of this notice the civil parish of Witton Gilbert is transferred from the Gateshead Division to the Durham Division and that the civil parish of Chopwell is transferred from the Newcastle on Tyne Division to the Consett Division The areas of these Divisions are thus as follows

Durham Division M B of Durham U D of Brandon and Byshottles R D of Durham *In R D of Chester le Street* C P of Witton Gilbert

Gateshead Division C B of Gateshead U Ds of Chester le Street Felling and Washington R D of Chester le Street (*except* C P of Witton Gilbert) Dunston part of Whickham U D

Consett Division U Ds of Consett Benfieldside Leadgate Annfield Plain Stanley and Tanfield R D of Lanchester *In U D of Blaydon* C P of Chopwell

Newcastle on Tyne Division C B of Newcastle on Tyne U Ds of Weetslade Newburn Gosforth and Longbenton R D of Castle Ward *In Durham* U Ds of Blaydon (*except* C P of Chopwell) Ryton and Whickham (*except* Dunston)

CHARLES HILL,
Deputy Medical Secretary

Branch and Division Meetings to be Held

BERKS BUCKS AND OXFORD BRANCH OXFORD DIVISION—At Radcliffe Infirmary Oxford Wednesday January 27 8 30 p m Professor L J Witts Anaemia in Women

CAMBRIDGE AND HUNTINGDON BRANCH PETERBOROUGH DIVISION—At Peterborough Memorial Hospital Wednesday January 27 3 p m Consideration of adoption of resolution under the ethical rules of the Division etc

KENT BRANCH—At Royal Fountain Hotel St Margaret's Street Canterbury Wednesday January 27 2 30 p m Special meeting to consider proposed alterations in the rules of the Branch 3 p m Mr L E H Norbury Some Recent Advances in the Treatment of Certain Conditions of the Anus Rectum and Colon

KENT BRANCH EAST KENT DIVISION—At Grand Hotel Clifton ville Margate Thursday January 28 8 45 p m Dr Geoffrey Evans The Value and Limitations of Rest in the Treatment of Disease Preceded by dinner at 7 30 p m

LANCASHIRE AND CHESHIRE BRANCH HYDE DIVISION—At Town Hall Thursday January 28 8 0 p m Professor L P Jacks The Liberal Education of the Body

LANCASHIRE AND CHESHIRE BRANCH MID CHESHIRE DIVISION—At Altrincham General Hospital Friday January 29th 8 0 p m Adoption of accounts election of officers etc

LINCOLNSHIRE BRANCH LINCOLN DIVISION—At Alb[illegible] Lincoln Thursday January 28 8 0 p m Discussion Epi[illegible] Pain

METROPOLITAN COUNTIES BRANCH LEWISHAM DIVISION—At Catford Town Hall Tuesday January 26 8 45 p m Dr W [illegible] Diagnosis Drug Eruptions of the Skin

NORTH OF ENGLAND BRANCH BLYTH DIVISION—At Kitty's Hotel Blyth Wednesday January 27 8 p m Superannuation Medical practitioners and war service Midwives Acts etc

NORTH OF ENGLAND BRANCH SUNDERLAND DIVISION—At Royal Infirmary Tuesday January 26 8 p m Annual meeting Consideration of annual report election of officers etc

NORTHERN IRELAND BRANCH—At Medical College Square North Belfast The [illegible] Wing Commander E J Hodges [illegible] Air Raid Precautions Nottingham and [illegible] students invited to attend

NORTHERN IRELAND BRANCH NORTH EAST ULSTER DIVISION—At British Legion Hall Magherafelt Friday January 29 8 30 p m R J Johnstone Maternity Services in Northern Ireland

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION—Thursday January 28 Dr H R Frederick Contraception Historically Surveyed

SURREY BRANCH KINGSTON ON THAMES DIVISION—At Public Assistance Department Norbiton Friday January 29 8 30 p m Colonel G Wallace Air Raid Precautions and Anti gas Treatment

WILTSHIRE BRANCH SWINDON DIVISION—At Medical Institute Swindon Wednesday January 27 8 p m S R Cox M (Oxford) Some Effects of Faulty Nutrition

YORKSHIRE BRANCH HUDDERSFIELD DIVISION—At Clinical Laboratory Huddersfield Wednesday February 10 BMA by Dame Louise McIlroy Practical Intervention in Obstetric Practice [illegible] at 7 30 p m

YORKSHIRE BRANCH SCARBOROUGH DIVISION—At Scarborough Hospital Thursday January 28 8 30 p m Dr D C Muir (Hull) Acute Medical Emergencies

VACANCIES

All advertisements should be addressed to the Financial Secretary and Business Manager and NOT to the Editor

ACCRINGTON VICTORIA HOSPITAL—H S Salary £1 0 p a

BANGOR CAERNARVONSHIRE AND ANGLESEY INFIRMARY—Hon Gynaecologist

BATH EAR NOSE AND THROAT HOSPITAL—H [illegible] S

BATLEY AND DISTRICT HOSPITAL—R H S [illegible] Salary [illegible] p

BEDFORDSHIRE COUNTY COUNCIL—Assistant County T O H and M O H for the Biggleswade Urban and Rural Districts (male) Salary £800 £25 £900 p a

BIRMINGHAM AND MIDLAND HOSPITAL FOR WOMEN—H S Salary £100 p a

BLACKBURN LANCASHIRE MENTAL HOSPITALS BOARD Brookhall—A M O (unmarried) Salary £500 £25 £600 p a

BOOTLE COUNTY BOROUGH—Assistant M O H and Assistant School M O Salary £500 £25 £700 p a

BRADFORD ROYAL INFIRMARY—R S O (male unmarried) Salary £2 0 p a

BRISTOL EYE HOSPITAL—Whole time Orthoptist

BRISTOL ROYAL HOSPITAL FOR SICK CHILDREN AND WOMEN—(1) Hon P to In patients (2) Hon P to Out patients

CROYDON COUNTY BOROUGH—Assistant M O H and Assistant School M O (male) Salary £500-£25 £700 p a

DERBY DERBYSHIRE ROYAL INFIRMARY—Gynaecological H S and Emergency Anaesthetist (male unmarried) Salary £150 p a

tried to keep them on one dose a day wherever possible When this was done the blood sugar usually rose between meals and fell again when the meal was taken, and after supper it fell and they remained sugar-free until the next morning He had spread out the carbohydrate over all the meals and still got a sugar-free night in most cases He pleaded for a stronger solution The 60 or 70 units necessary for the one-dose treatment was a very large dose for small children

Dr GEORGE GRAHAM had found the preparation helpful in the case of people who swung very quickly from a high blood sugar in the morning to an overdose in the middle of the day and high blood sugar again in the evening He agreed with Dr Payne as to the need for a stronger solution He hoped it would be possible also to produce a quicker acting insulin for the sake of the diabetics who during a prolonged life would get worse and want insulin at least three times and perhaps oftener a day

Dr T IZOD BENNETT said that he had been using protamine insulin on a series of children at Middlesex Hospital for many months and in every case he had been able not only to diminish the total amount of insulin employed, but the number of injections given though in only one case was the number brought down to one a day The other children were having two injections a day, and in the majority of cases it had been possible to abolish the glycosuria present in the morning at breakfast He had experienced difficulty with reactions but these were less violent than with ordinary insulin He agreed with Dr Payne with regard to the change of temperament in children, but that was only another way of stating that the patient who was successfully treated with protamine insulin had less frequent phases of hypoglycaemia, and in consequence was a very different person from the standpoint of general health and mental irritability Often these patients had spoken of their increased feeling of well-being when these hypoglycaemic attacks, often so slight as to be unrecognizable, had been abolished The introduction of these substances was going to make the work of the physician more difficult, and with a view to keeping practice within the bounds of reasonable facility he had never treated any patient with two different forms of insulin simultaneously There must be great potential danger to the patient who got one sort of insulin in the morning and another sort at night He could not have that for many years without accident, and that was a practical point which those employing insulin should constantly bear in mind But these slow insulins had undoubtedly come to stay, and those employing them clinically should make every endeavour in each case to employ one kind of insulin, changing over to another if necessary, but not using several different forms of insulin at the same time Another difficulty was that of assessing dosage Protamine insulin could no more be measured in terms of international units than, say, adrenaline could be measured in the terms of pituitrin The substances had different actions and so the same standard could not be applied to all of them This would create difficulty because it was open to any manufacturer to place on the market any of the new insulins and leave it to the clinician to work out what the dose should be He hoped the British manufacturer would walk a little less in the rear of his competitors in other countries Protamine insulin, zinc insulin and so-called crystalline insulin were appearing from abroad and so far the British manufacturer was watching with reverence and still turning out the excellent insulin we have been using until the last year or two That I think is to be deplored from the national point of view

Conclusion

Dr HAGEDORN said that he thought it might be possible to use a stronger solution One dose a day was the ideal and it could be carried out in hospital, but with more difficulty at home, and he thought it well to be cautious and not go too far in the one daily dose direction In fact the whole question called for caution An American had said that patients suffering from severe diabetes were sailing unknown seas, and it might be added that those responsible for their treatment were in the same boat

Mr F H CARR as a British manufacturer desired to say a word in reply to Dr Bennett's criticism The British manufacturers were working together at this moment with a view to meeting exactly the requirements of the Medical Research Council and the medical profession in respect of insulin They had been working intensively in recent months, and some practical issue might be expected before long There was, however, a patent for the manufacture of protamine insulin, and except by the kindness of Dr Hagedorn or by means of opposing that patent British manufacturers would not be free to make protamine insulin

ALCOHOL AND MOTOR ACCIDENTS

At a meeting of the Society for the Study of Inebriety held on January 12 Dr H M VERNON opened a discussion on "Alcohol and Motor Accidents" He pointed out that though road traffic accidents had, during the last two years receded a little on the maximum observed in 1934, the fatalities still averaged eighteen a day and the injuries over 600 Half of the fatalities were incurred by pedestrians and a fifth by pedal cyclists, while drivers of motor vehicles and their passengers experienced only a third to a fourth as many accidents as pedestrians The Ministry of Transport attributed considerably fewer of the fatalities to drivers than to pedestrians, but estimates made in France, Holland, and America assigned from 67 to 80 per cent of them to drivers

Of the various individual causes of fatal accidents speed appeared to be the most important The Ministry of Transport considered that of the fatalities attributed to drivers in 1935 a fourth were due directly to excessive speed, but many of the other causes tabulated were due in some degree to this cause—for example, the 117 fatalities due to "overtaking improperly," the 114 due to 'swerving,' and the 186 due to "failing to keep to near side" The Ministry's data for 1933 showed that private cars and motor cycles incurred their largest proportion of accidents when travelling at a speed of 20 to 40 miles an hour, while vans lorries, and public conveyances incurred their largest proportion at a speed of 10 to 20 miles Now it had been estimated that on an average vehicles of these latter classes travelled eight to sixteen times further than motor cycles before causing a fatal accident, and two to three times further than private cars, so there seemed to be a close relationship between speed and likelihood of accident In Berlin it was found that when in 1927 the speed limit for lorries and taxi cabs was suspended accidents of all kinds (including collisions) increased two- to three-fold, but the rules governing the speed limit of private cars were not altered, and it was found that in their case the number of accidents increased only 3 per cent Converse evidence was obtained in Rhode Island, USA for when the average speed was reduced from 37 to 31 miles per hour the fatalities were reduced 27 per cent

Alcohol and the Speed Factor

The importance of the speed factor was emphasized by Dr Vernon because of its relation to the effects of alcohol consumption on drivers The special committee of the British Medical Association on "The Relation of Alcohol to Road Accidents" reported in 1935 that moderate quantities of alcohol, such as 34 c cm, or the equivalent of three ounces of whisky had been shown by psychological tests to diminish attention and control and to reduce the rapidity and accuracy of co ordination with which movements of the eyes, hands, and legs were

ENDOCRINES IN THEORY AND PRACTICE

THYROID EXTRACT IN CONDITIONS OTHER THAN MYXOEDEMA

BY

D MURRAY LYON, M D, F R C P Ed

The discovery that a drug acts successfully in one disease inevitably leads to a trial of its powers in other conditions At first it will be tried in allied disorders in which it may be expected to produce some benefit, and later it will be given empirically in many other complaints Such has been the history of thyroid extract A survey of the literature will show that it has been employed in almost every department of medicine and that it has been recommended for the most unlikely conditions

The active principle of the thyroid possesses definite pharmacological actions both in the healthy body and in disease Thyroxine increases general metabolism and raises the activity of many organs and tissues in the body Among other important actions it stimulates the sympathetic nervous system it has secondary effects on the circulation and it plays some part in controlling the water content of the body The extract is probably most successful in therapeutics where some definite pharmacological action is made use of It must be remembered however, that it is not possible to isolate the different actions, and when the drug is given for one specific purpose other unwanted side actions are apt to appear

Subthyroidism and Obesity

Mild degrees of subthyroidism not sufficiently marked to warrant a diagnosis of myxoedema are probably more common than is generally thought One or more of the following symptoms may suggest such a condition dry skin and hair, mental depression or dullness forgetfulness loss of energy, a tendency to chronic constipation a predisposition to colds, and some vasomotor disturbances a useful confirmatory sign is a thinning or loss of hair from the outer third of the eyebrow Such signs will indicate the administration of small doses of thyroid and the improvement in the general health of this class of patient under such treatment is often remarkable

Thyroid has been much used in the treatment of obesity which may be caused by different factors in different individuals Some obese patients are definitely subthyroid, showing some of the signs mentioned above and often having a characteristic round moon face, in these thyroid extract is obviously indicated It is also given in cases with no signs of thyroid insufficiency and in those in which there is disturbance of the other endocrine glands Here the idea is that the thyroid extract will stimulate the general metabolism so that the patient may be able to use up some of his excessive stores of fat It must be remembered however that in obesity the basal metabolic rate is not abnormal It is usually within the normal range and since the basal metabolic rate is calculated on the area of the body surface which of course is increased in these subjects the metabolism may be actually in excess of that of a person of average proportions

Thyroid extract given to obese individuals must tend to raise the metabolism above normal but it cannot be relied on by itself as a treatment for excessive weight Given alone it is often unsuccessful for it increases the appetite, which neutralizes its action on the general metabolism As an adjunct to carefully chosen subcaloric diet (say 1 000 calories) it has a most important place in therapy Obesity in some patients particularly those who have been large eaters can be successfully reduced by dieting alone In others dieting fails to accomplish all that is desired For a time they lose weight on the low diet satisfactorily enough then the metabolism adjusts itself at a new level and loss of weight gradually ceases When this point has been reached the diet should be continued as before and thyroid treatment should be started the dose being slowly increased till a satisfactory rate of fall has been again secured In this way the patient may continue to reduce in weight for many months When thyroid is begun there is little evidence of its action on the weight for three or four days then a rapid drop takes place during the next few days apparently due to displacement of fluid from the system The fall after this is less rapid, but continues steadily for a time Under continued administration of thyroid the pulse rate will quicken and the basal metabolic rate gradually rises A value of + 20 to + 25 may be reached before cardiovascular symptoms appear The amount of thyroid which obese patients can take without trouble varies with each individual Some appear to be excessively sensitive while others can tolerate very large doses without discomfort When reduction of weight has been completed a few patients can keep their weight down without further treatment some must continue to restrict their diet and others must take small doses of thyroid extract if they are to prevent reaccumulation of fat

Use of Thyroid in Various Disorders

The thyroid gland has important interrelations with the rest of the endocrine system acting with some of the hormones and against others Thyroid extract has been employed in place of other hormones which were not available on the market but the successful commercial production of an ever-increasing number of endocrine substances will limit this use of it It is still often given in certain cases of pituitary insufficiency and in such conditions as amenorrhoea and the disturbances of the menopause It is also a common ingredient of pluriglandular compounds and in some may be the *only* active agent In most cases it is probably best to administer the thyroid separately so that the most appropriate quantity may be more accurately judged

Thyroid extract is sometimes of value in the treatment of asthma When the patient is grossly overweight and the excessive fatty covering of the chest embarrasses the breathing its use can be readily understood In cases of asthma thyroid extract may act in another way It may stimulate the adrenals and it increases the sensitivity of the sympathetic elements on which adrenaline acts Because of the stimulating action on metabolism thyroid extract cannot be freely given in the thin type of asthmatic

The striking improvement in the skin of myxoedematous patients under treatment has suggested the use of thyroid extract in dermatology It has been tried in a large variety of skin lesions but is now mostly advised in chronic conditions of a non-inflammatory nature The skin may be kept in a tolerable state in some cases of

ENGLAND AND WALES

A Veteran Medical Charity

At a meeting of the court of the directors of the Society for Relief of Widows and Orphans of Medical Men, held on January 6, with Mr V Warren Low, president, in the chair, six new members were elected and one death and one resignation were reported From the ordinary funds £1 540 was voted, and from the Brickwell Fund £541 5s for the payment of the half-yearly grants to the fifty-nine widows and nine orphans in receipt of relief A widow of a deceased member was voted an annual grant of £50 from the ordinary funds and £10 from the Brickwell Fund A sum of £640 was distributed in December as Christmas presents, each widow receiving £10 and each orphan £5, in addition to their ordinary grants In 1938 the society will celebrate the 150th anniversary of its foundation Membership is limited to registered medical men who at the time of their election are resident within a twenty-mile radius of Charing Cross After election they may remove beyond this radius, but still retain their membership The annual subscription is two, three, or four guineas according to age at the time of election Relief is only granted to the widows and orphans of deceased members Full particulars and application forms for membership may be obtained from the secretary at 11, Chandos Street Cavendish Square, W 1 He attends there, should a candidate desire an interview, on Wednesdays and Fridays between 4 and 5 p m

The Midwifery Service

The annual report of the Central Midwives Board for the year ended March 31, 1936 (H M Stationery Office, 2d) shows that on that date there were 62 064 women on the midwives roll, a net increase of 3,100 on the total for the previous year Only a little more than a quarter of the total number of qualified midwives are actually engaged in the practice of their profession—the number practising during 1935 being 16,165 Over the whole country three out of every four candidates who sat for the examination in midwifery during the year were successful, but the proportion varied in different examination centres—four out of five passed at Newcastle-upon-Tyne but only two out of three at Liverpool and Manchester The report states that during the year the Board proceeded further with the revision of the training and examination rules, and, after the close of the year, approved the final draft of the new rules which has since been submitted to the Minister of Health The report includes notes of interesting decisions given during the year on midwifery etiquette and practice and a warm tribute is paid to the services of Dr J S Fairbairn, who took an active part in the Board's deliberations throughout his membership from 1918 to 1936 and was chairman during the past five years Admiration is expressed for the immense efforts which he made to improve the status of midwives and midwifery in this country

Coming of Age of Star and Garter Home

The twenty first anniversary of the Star and Garter Home for disabled sailors and soldiers has just been celebrated In the early part of 1916, when the pressure of war casualties made it necessary to evacuate from the war hospitals paralysed patients who appeared to be incurable, a temporary hospital of sixty-five beds for their use was installed in the banqueting hall and ballroom of the Star and Garter Hotel, then derelict, overlooking the Thames at Richmond The hotel was purchased as a hospital, largely as a result of a public appeal by the Auctioneers and Estate Agents' Institute and presented to Queen Mary as the foundation of a permanent home for paralysed and disabled ex-service men The British Red Cross Society was entrusted with the duty of carrying out the scheme, and after the war the hotel buildings were pulled down and the present beautiful home erected on the site, the funds being subscribed by the women of the Empire as their war memorial In its early years the home admitted only victims of the war, but it is now open to all disabled ex-service men except those suffering from certain specified diseases At present 186 patients are being cared for and the waiting list of applicants is larger than ever before At the celebration of the coming of age a message was read from Queen Mary as patron of the home saying that she rejoiced to think that so many of the men disabled in His Majesty's service had found on Richmond Hill a happy and comfortable home, and had been spared so much suffering and distress that might otherwise have been their lot The need for continued public support was voiced by Air Marshal Sir John Salmond, president of the home and Sir Arthur Stanley, chairman of the governors The home, with its seaside branch at Sandgate costs some £48 000 a year to maintain and some of the patients can make little or no contribution to their maintenance Sir Arthur Stanley mentioned the debt of thanks owing to Sir Edward Cooper for his gratuitous work in designing the home and supervising its building

SCOTLAND

New Aberdeen Professor

As briefly recorded on another page Professor John Stirling Young has been appointed to the vacant chair of pathology in the University of Aberdeen in the place of Professor Theodore Shennan, resigned Professor Young graduated M A at Glasgow in 1919, B Sc in 1921, and M B, Ch B with honours in 1923, proceeding to the M D with honours in 1929 During his course at the University of Glasgow he gained the Brunton Memorial Prize in 1923 and the Bellahouston gold medal in 1929 After holding resident posts in the Western and Royal Infirmaries of Glasgow he became assistant to the professor of pathology and assistant pathologist at the Western Infirmary in 1924 In 1927 he was appointed reader in experimental pathology and assistant director of cancer research in the University of Leeds and in 1932 he became professor of pathology in Queen's University, Belfast a post which he still holds He has made numerous contributions to the literature of his specialty

Physical Fitness in Scotland

In an address to the Edinburgh City Business Club on January 12 Professor P S Lelean of the department of public health in the University of Edinburgh drew attention to a deplorable loss of fitness in Scotland He said that maternal mortality was the keystone of a nation's health and in Scotland the maternal mortality rate last year had been 50 per cent above that in England, while it was double that of Holland In fourteen countries of Europe the infant mortality rate was lower than it was in Scotland last year, and in England it was only 75 per cent of that in Scotland, although in 1900 the English figure had been worse than the Scottish Another fact was that out of 100 000 school children examined in 1934–5 in Glasgow, 93,000 were defective of whom 87,000 were suffering from remediable defects In order to assess the health of adolescents one might take the recruiting figures which bore upon the age of 18 Last year, out of 80,000 young men who presented themselves for recruiting, 37,000 were rejected at sight and another 17,000 on medical examination, or, in other words, two out of every three were rejected With regard to persons insured under the National Health Insurance Act, on an average each worker was off work eleven days in a year and one out of every five was incapacitated for seven

NATIONAL RADIUM REPORTS

THE RADIUM TRUST

The seventh annual reports of the National Radium Trust and the Radium Commission were published at the end of last week.[1] The report of the Trust covering the twelve months to March 31, 1936, mentions the following changes in its membership Mr Ramsay MacDonald Lord President of the Council succeeded Mr Baldwin as chairman, Sir Kingsley Wood Minister of Health succeeded Sir E Hilton Young (now Lord Kennet) Sir William Bragg President of the Royal Society succeeded Sir F Gowland Hopkins Sir Cuthbert Wallace already a co opted member succeeded Sir Holburt Waring on becoming President of the Royal College of Surgeons of England and Sir Humphry Rolleston, acting President of the British Medical Association, succeeded Dr S Watson Smith In place of Sir Comyns Berkeley and Sir Arthur Hall who had ceased to be members of the Radium Commission in accordance with the provisions for retirement in rotation Sir Cuthbert Wallace and Mr G F Stebbing both members of the Radium Commission, were appointed members of the Trust

The report states that the need for further considerable supplies of radium envisaged by the Commission, together with the trend towards the use of larger units, will, during the next few years make demands upon the Trust far beyond its present financial resources It had been hoped that a considerable increase of the national stock of radium might form part of the National Memorial to King George V but the final decision of the Memorial Committee was in favour of another charitable object An account of subsequent arrangements by which radium is being made available to the Commission during 1936–7 will be given in the report for that year A bequest amounting to about £7 000 of the late Miss Helena Day for the purchase of radium for cancer research and cure " is now under the administration of the Trust

With regard to the small quantity of radium loaned to the National Physical Laboratory for the purpose of physical research, it is stated that further investigations have been carried out concerning problems connected with gamma ray dosage and protection A parallel plate free air chamber erected during the year is believed to be the largest of its type ever constructed It has vertical electrodes 3½ metres high and affords an electrode separation of three metres such dimensions being found to be necessary in order to measure all the energy of the long-ranged secondary electrons produced by the gamma rays The question of the protection of radium workers has also received attention and a paper has been published dealing with the protection afforded by building materials This paper provides data which should be useful in designing rooms for radium beam therapy

Kaye G W C Bell G E and Binks W *Brit J Radiol* 9 161 March 1936

The Radium Commission

The Report of the Radium Commission covers the twelve months to July 31 1936, during which period there were no changes in the personnel of the Commission The distribution of the various radium centres in Great Britain is shown in the accompanying map reproduced from the Report The Commission notes with approval the increasing tendency of centres to employ a physicist, whose expert knowledge is valuable in questions of dosage and protection With regard to patients attention is drawn to the unfortunate position of the middle class section of the community In several centres no system of pay beds is yet available and it is stated that the Commission would view with sympathy any practical scheme for making national radium available to this class of patient whether treated in the parent hospitals or in associated institutions Also under present conditions patients in remote country districts may have difficulty in obtaining radiation treatment Although the Commission favours the policy of concentrating the actual treatment at the various centres it warmly advocates a dependent system of outpost centres for purposes of examination, diagnosis and follow up It is desirable that the influence of every radium centre should be disseminated as widely as possible in the surrounding districts The Report stresses the importance of securing the close co operation of municipal and county authorities for it is roughly estimated that out of some 40 000 patients suffering from forms of cancer suitable for radiation treatment only 8 000 or approximately one in five, are actually thus treated

With regard to the question of treatment by large radium units it is remarked that at present many cancer patients delay in seeking assistance through fear of the treatment From this point of view surface irradiation is preferable to interstitial irradiation The Report stresses the responsibility of the larger and better equipped centres for the provision of the trained workers of the future Radium is not only valueless but dangerous in the absence of knowledge and experience

National Radium Centres

Summaries follow recording work and progress at the National Radium centres the regional centres and the recognized hospitals The Aberdeen centre is fortunate in a close collaboration between university and hospital for both the radium officer and the physicist hold full time university lectureships Much attention has been paid to the questions of protection of the staff and to the accurate measurement of dosage in roentgens Radium finders of both the electroscopic and Geiger types have been installed At the Birmingham centre the radon plant which is under the direction of the physics department of the university continues to increase its output The centre will probably use the radium at present in solution to assist in building up a large radium unit the university meanwhile making itself responsible for a new supply of radium to replace that in the radon plant About one third of the radon output is utilized by the centre and the remainder is supplied to outside bodies At the Bristol centre the position is less satisfactory It would seem that the centre during the five years of its existence has not been successful in gaining the confidence of the profession of the district which it serves Nevertheless municipal and county authorities are showing increasing interest in radiotherapy and a scheme of diagnostic and follow up clinics has been initiated in Wiltshire At the Cardiff centre the urgent and paramount need is an apparatus for deep x ray therapy necessitating the services of a whole or part time physicist The Edinburgh centre to which a full time physicist has now been appointed has effected a satisfactory fusion of the organizations dealing with deep x ray therapy and radium A one gramme unit has been in operation during

thus avoiding the need for intravenous infusion Fluids can be given in this way, either continuously or intermittently, for days if the condition of the patient demands it When the catheter is removed the wound heals normally and without the formation of a faecal fistula I have found that patients treated in this way usually make a remarkably rapid recovery and that they suffer less from intestinal distension than do those in whom appendicostomy has not been performed

I make no claim for originality in this treatment, which has, I know, been adopted by other surgeons in this country and abroad It is, however, a method which seems to be comparatively little known and which certainly does not enjoy the popularity which it deserves I feel sure that its more general adoption would save the lives of many of our most desperate cases and I hope that this note may encourage others to give it a trial —I am, etc,

HUBERT CHITTY,
Honorary Surgeon Bristol Royal Infirmary

Bristol Jan 13

Serum for Influenza

SIR,—The letter on this subject from Dr A H Douthwaite and Dr F A Knott interests me greatly, for it deals with a subject which I opened up during the pandemic in 1918

The question of specific therapy was one that could not fail to suggest itself to anyone who approached the subject with an inquiring mind, and particularly to those who appreciated the earliest cases seen in the epidemic It is in these early cases that the disease is seen to run its true and uncomplicated course, in these early cases the duration was a few days, with rapid recovery and an immunity of some indefinite duration

In a brief survey of the epidemic in Macedonia (Burnford, 1919) I stated

"Our treatment must be based on the hypothesis that the condition is one of toxaemia which leads to production of antitoxin " and again " with the growing conviction that the essential process was one of toxaemia, attention was directed to serum therapy, and we had in mind the idea that in the blood of convalescent patients would be found the antitoxin itself, and we are still of this opinion Unfortunately various difficulties presented themselves, and it was not until the end of the epidemic in the Dardanelles that we found an opportunity of putting these ideas into practice and then only in one case The patient was gravely ill, and indeed we had seen no other case of such gravity ever recover But he was given serum from several picked convalescents and slowly improved This case is put on record as suggestive and also as a proof that the use of serum was at least harmless, an essential factor in initiating further investigation on these unconventional lines "

Recognizing the much greater difficulties experienced in civil practice of carrying out such treatment I have often regretted my lost opportunities of testing out this idea on a large scale Hence I welcome the reappearance of the idea in your columns

If memory is not playing me false I think the treatment was actually carried out on a larger scale in the smaller epidemic which followed in about 1921 by observers in Australia and published at about that time Again, trusting to memory, I think the results were promising—I am etc,

Analysis of Clinical Statistics

SIR,—Mr I A Tumarkin's letter in the *Journal* of December 12, 1936 (p 1229) may appear to have cast such doubt on my article on problems of chance in clinical work (August 1, 1936, p 221) that those readers who already look askance at statistical methods may have been confirmed in their views, while others, previously undecided may have been convinced that such methods are unsuitable for ordinary clinical material It would be unfortunate if further misconceptions were introduced where misunderstanding is already so common, especially since Mr Tumarkin's letter justifies rather than controverts the purpose and results of my article

It is regrettable that Mr Tumarkin should consider my article as a special criticism of his work (March 21, 1936, p 580) rather than as a general discussion, but for any such discussion the choice of an example from an actual investigation so as to avoid lack of reality, may suggest an *argumentum ad hominem*—a suggestion which I endeavoured so far as possible to eliminate If I had been discussing Mr Tumarkin's investigation as such I should, of course, have proceeded to the comparison of samples (cures and failures in facial paralysis) without discussing at any length the estimation of odds Mr Tumarkin's work appears to be of high practical value, and it is in the tentative stages of such work that simple and well founded tests, often used in some other comparable branches of investigation are desirable, partly because they enable one to distinguish results that could reasonably be attributed to chance, and so to follow the indications that are likely to be most profitable, thus economizing time, effort, and financial outlay

With reference to the "simple error" into which he considers I have fallen, Mr Tumarkin's letter states that "the statistician in analysing a problem of which he has no *clinical* knowledge is liable to overlook certain factors" This was fully emphasized in my article, but has no bearing on the so-called "error," for even to the eye of an anatomist, it was clear that the failures of cure in Bell's palsy in Mr Tumarkin's table were more abundant than usual, and Mr Tumarkin had reasonably explained this by supposing that more cured patients than failures had omitted to reply to his questionary Mr Tumarkin's table showed the information from the available samples, and the lines that immediately followed the table read "Stated simply it may be said that if the patient has both pain and loss of taste the chances are 2 to 1 " odds considerably at variance with those indicated in the table itself It was therefore natural to suppose that the author intended to calculate the odds from the available samples and to let his statement regarding unanswered questionaries indicate that if these had all been answered the odds in favour of cure would very likely have been greater—a very satisfactory form of argument There was surely, therefore, no need to write to the author before I made such statements as "The chances of cure in such cases, so far as they can be estimated from this sample, are eighteen out of twenty ", or before making the suggestion, for example, that "the odds of 2 to 1 seem to have been derived from a consideration of the eighteen failures " This suggestion was not of "elementary mistakes in arithmetic," but of comparing inappropriate data in the table It was surely not so uncomplimentary to suggest a technical error in the estimation of odds (a procedure not in daily use) as to suggest that an author, presenting data and ideas for the use of others, had (1) without informing the reader introduced

may have some neurological significance The conclusion is reached that mental deficiency is the result and consequence of a brain too small for its proper functions a disorderly arrangement of the cells of the cortex was also found

Histological innervation of the cerebral circulation in man was undertaken at the Manchester Royal Hospital Cheadle, Cheshire with a view to elucidating the nature of epilepsy and allied psycho neurological states It was shown that the intracranial circulation possessed a sympathetic innervation not differing materially from that in the remainder of the systemic circulation with which it was continuous Morphological support was thus afforded for the physiological and clinical hypothesis that the cerebral circulation possesses a vasomotor and a vasosensory mechanism which may well be concerned in such conditions as migraine certain forms of vascular headaches and cerebral angiospasm a syndrome simulating cerebral thrombosis Again an explanation is now forthcoming of the post operative phenomena which follow cervico dorsal sympathectomy Reference is made to the report in the *Journal of Neurology and Psychopathology* (1935) by W R Ashby and R M Stewart of the Leavesden Mental Hospital that the convolutions in the brains of defectives are a little narrower than in the normal brain that they are slightly smaller all over and that there is a strong tendency to variability

Chronic Infective Processes

A long and impressive communication from the Birmingham Mental Hospital Committee relates mainly to investigations by a team of workers who concentrated on the relation of bodily processes and especially septic foci in the skull to mental disorders from the points of view of aetiology and treatment Nasopharyngeal sepsis requiring treatment was found in 1 888 out of 2,068 cases of mental disorder tonsillar disease being present in 1 336 and infection of the nasal sinuses in 1 425 out of which latter series ethmoidal disease was present in 812 and sphenoidal disease in 573 Local treatment benefited the mental condition in a large percentage of these Clinical details are recorded of thirty eight cases to illustrate the therapeutic significance of this factor in mental disease Transmissible familial infection is submitted as a more hopeful and practical alternative to the view associated with heredity and is illustrated by notes of four families in whom mental disease occurred and was believed to be due to sepsis It is suggested that the nasal sinuses should be systematically examined during necropsies at all mental hospitals with an adequate number of corresponding examinations at general hospitals to serve as controls References to infections as an aetiological factor appear in the reports of some other hospitals For example research work has been proceeding since December 1934 at the East Sussex County Mental Hospital in respect of infections of the renal tract, injections of autogenous *B coli* vaccines were definitely valuable in two out of seven cases From the results of routine urinary examinations at the Cheshire County Hospital Macclesfield it would appear that some degree of nephritis is very prevalent among the subjects of mental disease granular renal casts being often found The causative organism in pyogenic infections of the urinary tract was always found to be *B coli* except in one case secondary to prostatic enlargement in which *B morgagni* was persistently present

Dysenteric and Typhoid Infections

Thirteen communications from mental hospitals and three from mental deficiency institutions record work in this connexion Prophylactic inoculation against dysentery has been continued for the seventh year among patients newly admitted to the Bristol City Mental Hospital where the Flexner W strain is used No case occurred in 1935 and in the seven years there were only fifteen cases compared with 157 in the previous seven years before the inoculating began The method is therefore warmly commended but the question is raised as to the duration of immunity It is concluded that, while the first inoculated patients probably still retain some degree of resistance to the infection it is advisable to re-inoculate all patients who received their injections more than five years ago This was undertaken therefore during 1936 The report includes the seventeenth post war report on asylum dysentery and allied infections from the West Riding Hospital Wakefield Nine cases of dysentery occurred in 1935 all in the chronic male wards the causative organism in eight being *B flexneri* W Research is proceeding on anti-dysenteric vaccines The great importance of the weekly examination of the faeces of carriers is emphasized and also the value of Wilson and Blair's agar medium for isolating *B typhosus* from the stools Mention is made in the Leavesden Mental Hospital communication of a typhoid carrier a man aged 62 *who ceased to excrete typhoid bacilli for three years* the gall bladder was then removed and the bile was found to contain typhoid bacilli so that the patient was still technically a carrier From Denbigh comes an account of full and elaborate investigations of an outbreak of dysentery which with the communications from North Riding Wilts Caterham and East Sussex indicate how much labour and time adequate attention to these visitations involves while that from the last named hospital shows the importance of having laboratory facilities on the spot in order to deal promptly with the material

Biochemical and Physiological Researches

Special studies are now being made of the mode of action of narcotics including their effect on the blood calcium content At the Cardiff City Mental Hospital it was found that during prolonged narcosis there was a slow fall in the serum calcium of variable extent (0 3 to 2 mg per 100 c cm) which reached its maximum in four to seven days A day or two after the cessation of this treatment the serum calcium figure rose to the original level or even exceeded it without any dietary change having been made It is concluded that somnifaine narcosis brings about this result by lowering the activity of the parathyroid glands The fall is not pathological and no contraindication to this treatment is deducible from it Work at St. Andrew's Hospital Northampton showed that the blood cholesterol figure was higher in melancholia than in mania and that there was a gradual increase with advancing years up to the age of 70 in both conditions In the same institution the feeding of rabbits with cholesterol produced arterial disease due to deposition of the lipoid in the walls of the larger vessels but the condition was not analogous to arteriosclerosis in man the cholesterol being deposited only in the vessels nearest to the heart and in the cerebral vessels Alcohol in large quantities had no effect in preventing the deposition of cholesterol *in vivo* in the rabbit In a communication from the Staffordshire Mental Hospital at Stafford it is announced that cholesterol ester is absent in the erythrocytes and its ratio to the total cholesterol in the plasma in mental defectives averages 65 per cent In several institutions the appearance in mental disease of phenyl ketonuria with the excretion of phenylpyruvic acid has been studied the condition appears to be familial and may be related to mental disorder in the involutional period of life

Therapeutics

The widespread adoption of malaria therapy in general paralysis is shown by many communications The Devon County Mental Hospital at Exminster mentions that quartan malaria has been successfully used to reinfect patients who had become resistant to benign tertian malaria but that the incubation period may in some cases exceed one month Regret is expressed that this line of therapy is not employed more often and more energetically in early cases of general paralysis since the results have been so good and the improvement often better than when vaccines physical pyrexia and electricity have been tried as remedial agencies At the Swansea Borough Mental Hospital cases of anxiety states due to stimulation of the parasympathetic system have been treated most successfully with choline preparations it appears that a vicious circle is thus broken and readjustment of the patient is made possible At the Bristol City Mental Hospital *prominal* was substituted for gardenal sodium in the treatment of epilepsy with great improvement of the mental condition and reduction in the number of fits This drug is also commended in the communication from the Norwich City Mental Hospital

Prevention of Silicosis

SIR—In reply to the letter in the *Journal* of January 9 (p 95), may I draw Dr J A Goodfellow's attention to Dr Donald Hunter's contribution to this subject of which he may not be aware[1]

Dr Hunter points out that particles of silica could not retain momentum by the time they had reached the alveoli, and wounding of the lung tissue is therefore ruled out It seems probable, he adds, that the silica acts as a chemical poison, and the addition to the mine atmosphere of a germicide, as Dr Goodfellow suggests, would hardly meet the case It seems much more logical to remove the danger at its source, and instead of iodizing the atmosphere, which would seem to be an impracticable and certainly very expensive procedure, the solution may lie along the lines suggested by Jones in 1934 as quoted by Dr Hunter—namely, the utilization of the fresh uncontaminated surface atmosphere, which is already at hand in the air-pressure pipes supplying the pneumatic drills—I am, etc,

London Hospital, E 1, Jan 13 A L CRADDOCK

*** Dr Donald Hunter's work, to which Dr Craddock draws attention, was the subject of a leading article in the *Journal* of December 5, 1936 (p 1148)

Glycosuria

SIR,—In 1932 a patient of mine aged 28 years, who was suckling her 7-months infant, complained of painful and swollen breasts and of great thirst and frequent micturition On examination I found the breasts extremely swollen and tender with a breast pump I could only get a few drops of milk away In the urine I found 3 75 per cent of sugar In ten days the swelling of the breasts had disappeared and the urine was free from sugar

This unusual case supports Dr Oliver's conclusion (*Journal*, January 16, p 105) that glycosuria is a symptom and not an entity—I am, etc,

Birmingham, Jan 17 ROBERT ANDERSON, M D

Proposed Medical Scheme for Public Schools

SIR,—As a result of the increasing interest aroused in the health and physical development of the school child and the recent proposals of the Board of Education in this connexion I wish to make a strong plea, and submit a scheme, whereby ideas of a similar nature might be incorporated in the administration of the public schools of this country

Having been engaged as an investigating medical officer of a milk nutrition survey, conducted by the Milk Marketing Board and the Ministry of Health in certain elementary schools, and maintaining an absorbing interest in the recording of anthropometric data as a valuable asset to preventive medicine, I am convinced of the need for similar work of a permanent nature in public schools I believe that it is of vital importance that the physical development and well-being of our public school youth of to-day should receive as much attention and supervision as that given to schools under the administration of the Board of Education

The scheme would entail

1 An annual medical examination with the recording of anthropometric data together with certain physiological tests for the assessment of nutritional states of all boys (aged 12 to 18 approximately)

2 Supervision or suggestions as to the diet, particularly for those showing subnormal physique

3 Control of exercise on a scientific basis suited to the needs of the individual

4 Freedom of access to the medical officer by individual boys for information on the facts of life—this to be given individually when needed, during the annual medical examination

The administration of the scheme would be carried out as follows

1 The medical service to be under the control of the Ministry of Education or the board of governors of each school, and supported financially by a Government grant on a percentage basis with an annual contribution from the school fees

2 The appointment of suitable medical officers interested in such work on a whole time basis and employing a standard method of examination necessary for subsequent statistical calculations

3 According to the number of boys at the various public schools and the time necessary for annual examinations medical officers would be appointed to a group of schools sufficient for these examinations to be completed during each year

The medical officer would in no way interfere with the position and work of the attending medical practitioner to the school, but would rather co operate by referring such cases as needed treatment to him, should any such be discovered, during the annual examination In dealing with schools of this nature the parents interest and whole hearted support should be assured, and I consider that this would be obtained when the scope of the work and the individual supervision and interest shown for each boy's physical development is realized

Valuable data on the rate of growth and development of boys (aged 12 to 18 approximately) should be obtained together with a wider knowledge of the optimum diet and amount of exercise necessary for the maximum physical development of the individual boy Finally, I submit that this supervision would prevent the development of those cases showing a subnormal physique resulting from excessive exercise combined with undernutrition or malnutrition during the rapidly growing period of life—I am, etc

London, W 1, Jan 17 R J IRVING BELL

Information Service for Research Workers in Human Genetics

SIR,—My executive committee invites your co operation in making use of the service here announced and begs you to make it as widely known as possible

One activity contemplated in setting up the Clearing House for Human Heredity is the organization of information service for research workers in the subject The value of such a plan has been demonstrated in the information service already established for workers on drosophila, etc It should be noted that apart from convenience of ascertaining easily centres at which comparable work is going on the circulation of notice by those engaged in a particular inquiry of their work is a safeguard in dating priority—a point to which it is natural to attach some importance

Workers are requested to address to the Bureau a short paragraph describing the work on which they are engaged These notices will be multiplied and circulated to all those co-operating In the first instance this bulletin will be issued every twelve months Later supplementary bulletins will be issued more frequently Those using this service are asked to subscribe 5s, or a sum equalling approxi

[1] *Lond Hosp Gaz* Clinical Supplement, Industrial Diseases, December 1935 p 51

patient for general anaesthesia had been assessed The elimination of post operative shock had been possible in a large measure as a result of experimental work, but the successful conduct of the ten days following operation had only been brought about as a result of unremitting medical care

The graft operated not only as a new blood supply brought into direct relation with the ischaemic area of the coronary tree, but the natural collaterals in the mediastinum were both reinforced and given access to the ischaemic heart This second function of the graft was more important in man than in the animal for the vessels surrounding the pericardium seemed to be in proportion much larger It was obvious that deaths during the acute stage of coronary occlusion either from general heart failure or from perforation of an acute infarct, could not be avoided by means of a graft, and it was only when the patient had survived these immediate perils that he could be considered a possible subject, and only then when the natural processes of repair were adequate In every case of coronary thrombosis the fact must be faced that a second attack was likely it might be postponed for years, but the exact time of its coming could not be predicted and a favourable outcome of the second attack was only likely if the nature of the repair and compensation after the first attack had been efficient.

The interest of the surgeon was, of course specially directed to cardiac aneurysm, one of the less common sequels of cardiac ischaemia Although aneurysm of the heart was infrequent the rarity of the condition should not be exaggerated for in one year three cases came to necropsy in Lambeth Hospital An aneurysm was the clearest evidence that the heart had suffered a grave vascular catastrophe A second occlusion would either so limit the blood supply of the remaining cardiac muscles as to make them inefficient or there might occur a local necrosis of the aneurysmal sac with fatal perforation

The First Six Cases

The indications for the operation of cardio omentopexy were not very rigid He and those associated with him had been guided in each case by two considerations In the first place, they had demanded unequivocal evidence of cardiac ischaemia, and, secondly, they had proceeded to intervention only when it seemed that the immediate risks of operation were less than the patient must in any event run if his disease were allowed to pursue its natural course He gave brief notes on six cases The first was a man aged 64 operated on at Lewisham Hospital on January 4 1936 Four others were aged 65, 72, 48, and 65, and were operated on at Lambeth The sixth (age not stated) was operated on at Newcastle on Tyne General Hospital

In none of the cases was there any immediate anxiety either during the operation or in the post operative period It was clearly essential before contemplating a major operation on the type of patient who suffered from cardiac ischaemia that the intervention should be so conducted that the disturbance of the normal physiology was as slight as possible also that the factor of post operative shock should be eliminated The first essential was secured by the use of oxygen under positive pressure and the elimination of surgical shock was due in the first place to the general anaesthesia employed and also to the application of some findings on traumatic shock by Slome and himself in the College laboratory when they had shown that the two factors connected with surgical shock were fluid loss at the site of trauma and nervous impulses generated in the traumatized area and transmitted for a considerable period In the operation of cardio omentopexy an approach was used which enabled an almost bloodless exposure of the heart, and no large vessels were divided

It was the purpose of his lecture to demonstrate that cardio omentopexy was a feasible operation attended with a low immediate mortality A detailed report would be subsequently published by the medical staff of the clinic on the after history of the patients According to the experimental evidence although vascular connexions were present and demonstrable within three weeks of operation, vascularization increased with time and did not attain its maximum until at least a year had elapsed

Immediate Results

One of the patients, seven days after the operation died from haemorrhage due to a chronic duodenal ulcer but no post operative disturbance had been shown the blood pressure was 130 mm the pulse 80 per minute and the respiration 20 per minute two hours after operation and at necropsy everything in the chest was quite in order The second patient left hospital in good condition The third was able to get about very well The fourth whose age was 72 had a period of relief from angina and was able to go home but succumbed later to an attack of uraemia At necropsy a chronic interstitial nephritis was found The graft was quite firmly adherent to the heart The fifth case was that of a patient who had been bed ridden for eighteen months, and was now able to get up and walk about The sixth patient had left hospital

No post operative complications had occurred The temporary paresis of the diaphragm began to disappear after three months and there was no case of diaphragmatic hernia among these six patients He referred finally to the alternative operation suggested by Beck in which a pedicle graft of the pectoralis major was sutured to the heart He did not feel that the factors concerning shock could be so well controlled in Beck's operation as in cardio omentopexy In the Lambeth clinic it had been demonstrated that cardio omentopexy could be performed without immediate distress even in a type of patient ill suited to most surgical operations, such as a man aged over 70 and a bed ridden woman of 65 The graft fulfilled the immediate function of supplementing the blood supply to that portion of the myocardium still capable of function and in an area so ischaemic as to have lost its active function it prevented further necrosis

Mr O Shaughnessy concluded with several acknowledgements principally to the Medical Research Council the Council of the Royal College of Surgeons Sir Arthur Keith and Dr John Beattie as well as to his colleagues at Lambeth

---

O Henningsen (*Z Urol* 1936 vol 30, No 11 p 772) thinks that in prostatic hypertrophy there is in the first place an increase of the tonus of the vesical wall This increases the resistance to the flow of the urine at the ureteral papillae The back pressure is transmitted through the ureters to the kidneys The tonus of the bladder wall does not depend on the filling of the bladder but on the wall tension and consequently on the intravesical pressure The stimulation set up by chronic cystitis and by the hypertrophy of the bladder walls gives rise to an increase of tonus and to a decrease of the capacity of the bladder This condition often occurs in prostatic hypertrophy in the absence of residual urine The tension on the bladder wall can be partly relieved by a permanent catheter But a more effective relief is obtained through a suprapubic cystostomy Following this operation the kidneys may recover their function more or less completely

Sir J Y. Simpson and Chloroform

SIR,—From its very nature an abstract is apt to omit some detail and so convey a wrong impression This may be the explanation of the elliptical statement in the condensed version of Dr Douglas Miller's presidential address (*British Medical Journal*, January 9, p 87) that "after further research, in which self-experimentation played an important part, chloroform was discovered [by Simpson] on November 4, 1847" The actual antecedents of the discovery of the properties of chloroform as a general anaesthetic were assembled by me in a paper read before the British Pharmaceutical Conference in 1934, a reprint of which I enclose[1] Briefly, the relevant data are

1831-2, discovery of the chemical compound chloroform independently by Guthrie, Soubeiran, Dumas and Liebig 1833, chloric ether a spirituous solution of chloroform used internally by Dr Black of Bolton in asthma and adynamic conditions of the system 1838, chloric ether, which Mr David Waldie had brought to the notice of Dr Formby of Liverpool, prescribed by him as an anti-spasmodic 1842 Dr Mortimer Glover, a young Edinburgh graduate discovered by experiment that chloric ether was a powerful narcotic poison to animals, one of its effects being to induce in them anaesthesia and insensibility J Lyle Davidson a pharmacist in a letter to the *Pharmaceutical Journal* (January 25 1908) cites the testimony of his father that he, when a student at Newcastle-upon Tyne was for demonstration purposes put under chloroform by his teacher 1847 Flourens, the French physiologist demonstrated that the inhalation of chloroform caused in animals precisely the kind of anaesthesia induced by the inhalation of ether In the same year Sir William Lawrence and Mr Holmes Coote began to use chloric ether as a general anaesthetic at St Bartholomew's Hospital London having been made acquainted with its applicability for this purpose through an experiment on himself by an assistant in the service of Jacob Bell, one of the founders of the Pharmaceutical Society

Simpson's dramatic narrative of the after-dinner experiment in his house in Great Queen Street, Edinburgh, at least as regards his ostensible ignorance of the anaesthetic properties of chloroform, is discredited by the fact that Waldie of Liverpool had expressly suggested its use to him, and even more conclusively by the fresh evidence disclosed in the biography of Sir Robert Christison, in the passage now quoted

'One day when he, Dr Matthews Duncan—one of Simpson's colleagues—was in Dr Gregory's laboratory at the College, he got possession of every liquid in the laboratory which he imagined would breathe Four or five bottles were carried off, and chloroform was one At the time correspondence with Dr Waldie was being carried on and the suggestion by that gentleman to try chloroform had *not* been heard of by Dr Duncan He had previously experimented upon himself with various substances but found none suitable On trying chloroform he was convinced that the article sought for had been found The same or the next evening the trial was repeated by Dr Keith Sir J Y Simpson and himself This is the trial which is a matter of history but the previous trial has never been noticed

In the whole transaction Simpson shows up in an unfavourable light, especially by indefensible silence as to the lead given to him by Waldie and Matthews Duncan's experiment on himself To repeat what I wrote

'What is to his [Simpson's] everlasting credit, and forms the greenest and most lustrous leaf in his crown of bays is the intrepid and triumphant battle that he waged for the official adoption and establishment of chloroform as a general anaesthetic

Medical Service in the Territorial Army

SIR,—The country has decided that the time has come to look to our defences, and great efforts are being made to encourage the young men of the country to join the Territorial Army I feel that many medical men do not realize the advantage the Territorial Army offers in the matter of comradeship and opportunities to study their profession from a rather different aspect The general practitioner can find his sphere as a regimental medical officer or as a member of a field ambulance, the consultant as a member of a general hospital staff, the laboratory worker and public health officer in a hygiene company There is no great demand on the scant leisure of the doctor, and the pleasure gained is great If any medical man in the London district is interested and will write to me I will do all I can to help find him the right billet—I am, etc,

The New Journal Typography

SIR,—May I, as a brother Editor, congratulate you sincerely on your new format I think I can truthfully say that it has been only on the very rarest occasions that I have not "gone through" each weekly number since I became a member of the B M A over 40 years ago This even with holidays intervening as I have always had my numbers saved while I was away (world tour included) and have "gone through" them on my return My object has been to note, and generally to read, any article or information having reference to the department of medicine in which I practise and also to follow the political activities of the Association The new format makes this job infinitely more easy—I am, etc,

London W 1, Jan 15 COMYNS BERKELEY

The Services

QUEEN ALEXANDRA'S MILITARY HOSPITAL

The War Office announces that Professor C Hadfield M D, F R C P, department of pathology, St Bartholomew's Hospital has been appointed honorary consultant in pathology to the Queen Alexandra Military Hospital Millbank, S W, in succession to the late Professor E H Kettle

COLONEL COMMANDANT R A M C

Major General H Ensor, C B, C M G, C B E, D S O, R A M C, R P has been appointed Colonel Commandant Royal Army Medical Corps vice Major General O L Robinson, C B C M G R A M C, R P, who has attained the age limit for his appointment

DEATHS IN THE SERVICES

Lieut-Colonel JOHN ROBERTSON I S O Indian Medical Department (ret) died at East Sheen on January 11, aged 74 He entered the Subordinate, now the Indian, Medical Department in 1882 and after his course of instruction at the Calcutta Medical College joined the Service as an assistant apothecary in 1886 He rose gradually in that Service till he attained the senior rank in it, that of senior assistant surgeon and major, retiring on March 1, 1926 Just previous to his retirement, on January 1, 1926 he was granted the rank of lieutenant-colonel, a rank which had previously been bestowed on only one member of the I M D the late Lieut Colonel T H Hill who was the last medical survivor of the Mutiny Robertson was selected for civil employ early in his service, and spent most of his time at Simla and at Nagpur, the capital of the Central Provinces where he was

tumours was very greatly needed but it was to be hoped that no needless change of the terms in common use would be made The terminology wanted clarifying rather than changing Most speakers had pointed out the difficulty of histological diagnosis in these cases yet many had insisted that such diagnosis should always be made It seemed to him that in cases where the radiological picture was definite and the histological picture less certain, the radiological picture should be preferred There were cases in which the radiologist made a mistake and the pathologist put him right but he thought that statistics would show that quite as many mistakes were made by the pathologist as by the radiologist in these cases

PROTAMINE INSULIN

At a meeting of the Section of Therapeutics and Pharmacology of the Royal Society of Medicine on January 12 Dr DOROTHY HARE presiding Dr H C HAGEDORN of Copenhagen delivered an address on protamine insulin

Dr Hagedorn said that the great discovery of insulin had made it possible for sufferers even in the more severe cases of diabetes to live and work almost like normal persons A small number of cases remained however in which entire success could not be obtained while difficulties were experienced in timing the effect of insulin Attempts had been made to prolong this effect in different ways At present the injection of insoluble compounds of insulin seemed to give the best results The use of the protamine insulin compound had been encouraging Dr Hagedorn entered somewhat deeply into the chemistry of the subject taking salmiridin —a monoprotamine from *Salmo irideus*—and discussing its quantitative relation with insulin and the influence of concentration *p*H and other factors Protamine insulin was stable under ordinary circumstances for many weeks and in cold storage for months Originally the name given to it was protamine insulinate to suggest that the protamine acted as base and the insulin as acid but it might be preferable not to make such an assumption and to call the material simply protamine insulin

Clinical Trials

Coming to the clinical experiences Dr Hagedorn said that before bringing protamine insulin into general use a few cases were treated over a period of a year and carefully watched for the appearance of unexpected difficulties. The statement that some patients did well on a new treatment might be very encouraging for them and for their doctors but it was far from being clinical evidence For this purpose all the conditions must be arranged as for a scientific experiment with controls He exhibited a number of graphs relating to typical cases treated with protamine insulin either alone in one or two daily doses or combined with ordinary insulin which was given in the morning, the protamine insulin being given in the afternoon Sometimes combined preparations of ordinary insulin protamine insulin and zinc protamine were used Very encouraging information was obtained from the patients or their relatives stating that they felt better and were less tired, especially in the hours when the blood sugar values were lowest or highest In the larger number of cases in which considerable oscillations in the blood sugar curve were noticeable an improvement was obtained In three cases complicated with Graves's disease not only was control of the diabetes secured, but the Graves's disease was ameliorated Dr Hagedorn concluded by saying

It has been most impressive with many patients both children and adults who used to have several periods in hospital each year being brought there either in a hypoglycaemic or semi comatose state to find them coming to hospital no longer We have had only one admission due to hypoglycaemia caused by a very big overdose being taken during alcohol intoxication! In another case coma developed during influenza, and the patient was brought to hospital with double pneumonia Having been delirious for ten days after taking an average of 240 units a day he finally recovered It appears that the dose of protamine insulin can be reduced to the extent of 15 per cent compared with ordinary insulin But we must not forget the other side It is not in every case that we succeed in keeping the blood sugar within reasonable limits and at present we are not able to say with certainty in which cases this can be done According to hitherto unexplained individual differences most likely in resorption from subcutaneous tissue some cases are found which do not react to the protamine insulin in the typical way

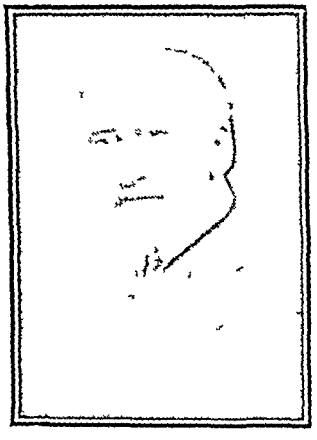
British Experiences

Dr OTTO LEYTON after a compliment to Dr Hagedorn who he said was one of the first to produce insulin in Europe and had conferred a further boon upon the diabetic by changing his life from one of hazard to one of comparatively even tenor described his own experiences with the preparation with which he had been supplied by Dr Hagedorn for quite a considerable time He warned those who worked with protamine insulin that perhaps chance might arrange that the first few cases in which it was tried would not yield successful results But it should be continued and eventually it would be found that between 60 and 70 per cent of cases reacted well He had been using protamine insulin in some cases in a single daily dose and when the diabetes was not severe this procedure had proved in many cases very successful Naturally the diet was altered Instead of distributing carbohydrate in the ratio of 40 per cent at the two meals which were preceded by insulin about 35 per cent of the carbohydrate was given at breakfast—that is one or one and a half hours after the injection of the insulin—50 per cent at lunch, 10 per cent at tea and 5 per cent at the evening meal No hard and fast rules could be laid down but something of that kind often succeeded when 40 units of insulin were required daily Another use of protamine insulin was in cases which were slowly improving Some patients continued to improve over a long period if the sugar content of the blood was kept low throughout the twenty four hours, and when say 12 units of insulin (6 units twice daily) were being taken one could not suddenly change the regime and give it all before breakfast but one could change to 12 units of protamine insulin and then gradually diminish and in some cases finally discard At the London Hospital some observations had been made to determine whether there was any difference according to the site at which protamine insulin was injected The difference in the few cases in which it had been tried was not sufficient to justify any real conclusion but it was thought that by injecting into a mass of fat the action might be longer and the effect had even been tried of injecting some of the precipitate intravenously when there was very considerable retardation in action The problem of why in some people protamine insulin acted very rapidly probably engaged the attention of all interested in diabetes It would be interesting to know whether in such cases some other precipitate of insulin acted rapidly also He could only confirm what Dr Hagedorn had said—that at present no one could predict definitely how the preparation would act In every patient careful observation had to be made to ascertain whether the action was rapid or long delayed In a few cases it seemed to be so long delayed as not to be recognizable at all

Use in Children

Dr W W PAYNE said that he had noticed in patients put on protamine insulin that they were less easily upset by the ordinary troubles of life Although he had found it difficult to keep children—among whom his work principally lay—completely sugar free on one or two doses of protamine insulin in practically every case there had been a marked improvement in their feeling of well being and their capacity for work and enjoyment He had

Obituary



WILLIAM HUNTER, C B, M D

LL D, F R C P

Consulting Physician, Charing Cross Hospital

We much regret to announce the death in London, on January 13, of Dr William Hunter, who was a pioneer in the application of Lister's teaching to general medicine, and more than thirty-five years ago arrived at the conception of what is now a commonplace—the influence of chronic local infection on the body generally

William Hunter was the eldest son of Robert Hunter of Birkenhead He was born on June 1, 1861, and received his medical education at Edinburgh University, where he graduated M B, C M in 1883 with first-class honours taking the M R C S Eng diploma in the same year His outstanding merits as a student were recognized by the award of the Bruney prize for the highest marks gained in anatomy, surgery, and clinical surgery during the medical examinations at Edinburgh, and also the Ettles scholarship for being the most distinguished student of his final year After serving as resident house-physician in the Royal Infirmary, Edinburgh, and on the staff of the Western Dispensary, he received a grant from the British Medical Association on the recommendation of the Science Committee and went to Leipzig (1884), where he worked in the pathological laboratory On returning to Edinburgh he continued in the Physiological Laboratory as assistant to the professor His researches were embodied in a thesis for his M D, on the physiology and pathology of blood transfusion and the fate of extravasated blood (1886), for which he received a gold medal He also held a research scholarship of the Grocers' Company

Hunter took an active and distinguished part in the scientific life of Edinburgh, being a Fellow of its Royal Society and president of the Royal Medical Society After some further work in Vienna he was awarded in 1887 the John Lucas Walker Studentship at Cambridge for whole-time laboratory research in pathology He held this post until 1890, and during its tenure worked on the problems of pernicious anaemia, visiting Strasbourg in search of experimental facts In 1889–90 he delivered the Arris and Gale Lectures before the Royal College of Surgeons on transfusion of the blood On leaving Cambridge he became assistant physician to the West London Hospital and to the London Fever Hospital, and later was appointed to the staff of Charing Cross Hospital and School as assistant physician, officer in charge of the electrical department, and joint lecturer in practical medicine and pathology From 1910 to 1915 he was dean of the school, and on retirement from the active staff he was made consulting physician

Hunter's name will be associated in medical history with his investigations over a period of twenty years on pernicious anaemia These he began in 1885, and he carried out the larger portion of this experimental work, histological and chemical, whilst holding the John Lucas Walker Studentship at Cambridge, the results were recorded in various papers between the years 1888 and 1890 His early researches suggested to his mind that pernicious anaemia was not merely a special form of anaemia but a definite and, in regard to mode of onset and site of infection, a well-characterized chronic infective disease, localized to the alimentary tract, one in which long-standing sepsis, oral and gastric, played an essential and important antecedent and concurrent part The anaemia itself, in his view, was not the sole feature and the cause of all its symptoms and lesions, it was only one of the symptoms, there being at least three other groups—haemolytic, gastro-intestinal, and toxic He was the first observer to note that the alimentary and nervous system were more or less seriously affected in the disease, and he recognized the importance of the deposit of iron in the liver, which he explained as being due to haemolysis in the portal system These researches on the iron in the liver and other organs formed the basis on which the haemolytic conception of the disease was based Oral sepsis and a tender tongue, he maintained in subsequent papers and monographs, were always present He did not approve of Ehrlich's theory that the megaloblastic marrow was concerned in the disease, it was not secondary to some debilitating organic disease such as cancer, but a primary disease The excess of pigment in the liver interested him greatly Previous observers had noted it but thought that it had no special significance, since it occurred also in other diseases Hunter, however, found that in no other disease was there so much pigment and iron in the liver In the monograph of 1901 on *Pernicious Anaemia* Hunter's clinical conclusions were drawn from only a dozen cases, met with in private or hospital practice His wider experience, especially on the clinical side, was recorded in *Severest Anaemias* vol i (1909) By this time he had definitely abandoned the term "pernicious" for any form of anaemia This he did "out of regard for the patient and in the interests of clinical medicine" because in his opinion the term connoted nothing but confusion, "without its equal in the history of any disease or group of disease" He preferred the term "Addisonian anaemia" He felt strongly on the matter and especially objected to Biermer's grouping of a number of different forms of anaemias as progressive pernicious anaemia, and to Ehrlich's blood observations "and the singularly misleading aetiological and haematological traditions, which in consequence of these observations have for the past thirty or forty years gathered around the unhappy and unfortunate name of pernicious anaemia" His 1909 conception of the disease in a nutshell was that "Addison's anaemia is a very remarkable disease of a specific infective haemolytic nature, the specific infection being localized to the alimentary tract" In the seven years before publishing this work he had had seventy-five cases under his care, and glossitis had been present in every one This volume has many tables and opinions of various observers arranged in parallel columns It also has several good pathological illustrations It is a work of reference but conveying all through in no unmeasured way the certainty of its writer of the soundness of his own view The second volume, on septic anaemia, which was contemplated, never saw the light of print Knowledge of this subject has grown apace in the past twenty-five years, and pernicious anaemia is now regarded as a true deficiency disease Not all of Hunter's view of symptoms is held to-day Thus glossitis or sore tongue is not met with in every case, and oral sepsis as an aetiological factor has faded into the background Recent observations also

made The alcohol must therefore in the opinion of the committee frequently affect the driving capacity of the driver and this adverse effect generally occurs even if alcohol is taken in moderate quantities some hours before driving It was evident that the adverse effects were more likely to lead to an accident the greater the speed of driving The influence of a small error of control became magnified in direct proportion to the speed while the distance within which a car could be pulled up when a pedestrian or other possible obstruction was seen varied as the square of the speed Allowing for the reaction time it was calculated that at a speed of 50 miles per hour the stopping distance was 149 feet but careful tests showed that this reaction time was increased by at least a tenth of a second after a moderate quantity of alcohol is taken and this would mean an increase of seven feet in the stopping distance However complex reactions might be lengthened by as much as 0 37 second and this time interval corresponded to twenty-seven feet of road space in a car going 50 miles an hour Alcohol had the additional effect of causing drivers unconsciously to accelerate their speed Tests were made by the lecturer at the National Institute of Industrial Psychology by means of the motor driving apparatus set up there The apparatus consists of a dummy car with the usual form of steering wheel and foot levers In front of the driver is a screen on which is projected a moving picture of a road along which the subject of experiment can drive the car in any direction he likes Experiments were made on twenty subjects who did three driving tests before drinking the experimental dose of alcohol and three further tests at intervals of one half to two and a quarter hours after it The drink consisted of 2½ oz of whisky containing 32 c cm of alcohol or of mild beer, containing 5 c cm and it was found that in the whisky experiments as contrasted with the beer experiments the subjects drove on an average 6 per cent faster but they made 13 per cent more errors in keeping to the track In a third of the tests the reduction in the time required to drive round the track ranged from 10 to 25 per cent and an acceleration of this sort which was usually made quite unconsciously by the subjects indicated the importance of all cars being compulsorily provided with a speedometer

Clinical Symptoms in Relation to Alcohol Concentration

The data adduced by the Ministry of Transport indicated that only 1 in 80 of the fatalities attributed to the various road users were due to the persons concerned being obviously under the influence of drink or drugs, but evidence from America suggested that alcohol played a much larger part than this in motor accidents It was stated that though alcohol was directly mentioned only in 7 to 10 per cent of the fatal traffic accidents the traffic commissioners and other informed individuals believed that probably a third or a fourth of the motor accidents were partly attributable to the consumption of alcohol by the drivers Again the records of our own police courts showed that in 1934 no fewer than 2 016 drivers of motor vehicles were certified by the examining doctor to be under the influence of drink to such an extent that they were incapable of proper control of a vehicle A new and more exact method of obtaining evidence on this very difficult problem was now being investigated and was found to throw a flood of light upon it It was based on the determination of the alcohol content of small samples of the blood or urine taken from the driver soon after an accident had been incurred In Widmark's micro method of analysis only two drops of blood were required, and estimates made by several independent investigators showed a rough correspondence between alcohol concentration and clinical symptoms Of the persons having 1 part of alcohol per 1 000 in their blood from 40 to 63 per cent were found to be under the influence of those with 1 7 parts from 80 to 88 per cent were so affected and of those with 2 parts the whole were so affected With regard to the blood analyses made on persons involved in motor and train traffic accidents two Swedish investigators Hindmarsh and Linde found that thirty three out of the 113 persons tested had more than 1 part of alcohol per 1 000 in their blood Heise in America found that of 119 drivers involved in motor accidents eleven had 1 4 to 3 5 parts of alcohol per 1 000 in their blood while seventy four of them or nearly two thirds of the whole had more than 0 2 part Analyses by Jungmichel of the blood of 298 persons involved in traffic accidents in Munich showed that only 8 per cent were practically alcohol free 15 per cent had 0 04 to 1 part per 1 000 39 per cent had 1 01 to 2 parts and 37 per cent had 2 01 parts or more The frequency with which large amounts of alcohol were found in the blood was due to the fact that the police had compulsory powers to take blood samples in cases of accident but apparently they exercised these powers only when they suspected alcohol as a causative factor The numerical data quoted went to show that in the great majority of cases their suspicions were well founded

Practical Inferences from the Data

It would be noted that in the large majority of blood samples analysed in Sweden and in America the blood was found to contain less than 1 part per 1 000 of alcohol so it might be thought that the skill of most of the drivers concerned was not affected but this was by no means the case W R Miles found, as the result of tests on nine subjects that after drinking the equivalent of 3 oz of whisky in concentrated form the blood alcohol rose to a maximum of 0 4 per 1 000 and when taken in a dilute form to 0 3 part per 1 000 Again Schmidt found that when the equivalent of 3 7 oz of whisky was given to forty four students and chauffeurs their blood alcohol rose to a maximum of 0 6 part per 1 000 the maxima in individual cases ranging from 0 4 to 0 8 part Since the psychological tests previously cited indicated that 3 oz of whisky or its equivalent had adverse effects on driving capacity it followed that such effects were usually present to some extent in drivers found to have more than 0 3 part of alcohol in their blood in spite of the fact that no symptoms of being under the influence were detectable by the methods of medical examination usually employed This conclusion led logically to the view advanced by *the Times* in a leading article when it said As things stand at present there would appear to be no absolute safeguard for the motor driver but total abstinence Such abstinence should be practised for several hours before driving as well as during its course for the rate of disappearance of alcohol from the blood is very slow It is got rid of—mostly by oxidation—at the rate equivalent to only 1 oz of whisky per hour in a man weighing 11 st

---

International medical post graduate courses in Berlin during 1937 include the following internal medicine from February 22 to March 6 (fee RM 75) additional training course for surgeons from April 5 to 10 (fee RM 70) additional training course in industrial diseases from April 5 to 10 (fee RM 50) special course in urology from April 12 to 17 (fee RM 60) diseases in health and disease from April 12 to 17 (fee RM 50) x ray diagnosis and treatment, from April 16 to 23 (fee RM 60) additional training course in orthopaedics from April 19 to 24 (fee RM 60) tuberculosis from May 3 to 8 (fee RM 50) and an additional training course in homoeopathy in two parts from April 5 to 30 (fee RM 75 for the whole course) These courses are given in German but special practical courses in other languages will also be held each month in all branches of medicine with clinical and laboratory work For programmes and further information application should be made to the Geschaftsstelle der Berliner Akademie fur arztliche Fortbildung Robert Koch Platz 7 Berlin N W 7

After a short period in general practice at Hampstead Thompson turned to ophthalmology, and served for some years as clinical assistant to Mr Lang In 1898 he was appointed assistant surgeon at the Western Ophthalmic Hospital, became full surgeon in 1901, and after serving as such for twenty years was made consulting surgeon, though he continued for some time after to help in the current work of the hospital To that institution he gave the best work of his life, and it is not too much to say that by his efforts and those of his then colleagues it was raised from an unimportant position to the honourable place it now holds among the ophthalmic hospitals of London Thompson himself spared neither pains nor money to help in bringing that about Accuracy marked his work as a surgeon In diagnosis he was rarely at fault, in operating careful to a degree, in treatment resourceful and always open to new methods High myopia was a subject which specially interested him While enjoying a fair private practice (on which he was not actually dependent), this allowed him time to use his pen, which indeed was rarely idle Though he never produced any book he contributed many papers and reviews to current ophthalmic literature, was joint editor of the *Ophthalmic Review* and for twelve years supplied material to the *Medical Annual* A fine piece of work on which he spent much labour, in conjunction with Mr Willoughby Cashell, is described in a paper recording the occurrence of sixteen cases of congenital optic atrophy in a pedigree of six generations

Too much devoted to his profession to require any absorbing hobby, Thompson was yet far from being a narrow specialist He enjoyed life on many sides In earlier years a skilful skater and skier, he was a keen golfer until his health began to fail A traveller, and widely read in modern literature, he professed advanced opinions on social and political questions without upsetting his more conservative friends And his genuine taste for art was shown in his support of the National Art Fund A surgeon of high attainments, he was also a cultivated gentleman That indeed was much, but Hugh Thompson was something more, for to those who knew him best he exhibited a life lived on a high plane, inspired by unselfish purpose, intent on serving his fellow men

The death occurred on January 13, at Stockport of Dr S H D GANDHI at the age of 55 years Descendant of an old Parsee family, Dr Gandhi received his early education in the State of Jodhpore, Rajputana, and later entered the Grant Medical College, Bombay, for his medical training He came to Manchester in 1902, became a student of the Victoria University, and graduated M B, Ch B in 1907 The first decade of his medical life was spent (in the words of Sir Andrew Clark) in "striving for bread" doing a few hospital appointments and numerous locumtenencies and assistantships in England and Wales In 1914 he settled at Stockport, and by dint of untiring hard work and great kindness to the poor and unfailing courtesy rapidly built up for himself a large practice, and so reached the 'bread and butter stage" of his life's work Ever ready and willing to respond to the ceaseless night and day calls in the life of a busy G P, he entered upon the third decade—" the cakes and ale stage "—which, alas! he never lived to enjoy A great student of languages and literature, he was the proud owner of a considerable library, a keen and good musician, he possessed a fine library of music, and in spite of his laborious life managed to snatch time for the pursuit of these hobbies, looking upon his beloved library as a great catalyser His health began to fail three years ago, and early in 1936 his illness forced him to take to his bed, which he practically never left His loss will be keenly felt by a large number of patients, especially the needy poor

Dr MARGARET THACKRAH died in London on January 10, aged 56 She was educated at the North London Collegiate School and University College, London, where she took her B A degree In 1903 she entered the London (Royal Free Hospital) School of Medicine for Women, qualifying M B, B S in 1909 After holding several resident appointments, including those of house surgeon to the Royal Free Hospital, medical officer at Maltings Farm Sanatorium, Nayland, and medical officer to the C E Z M F Hospital, Quetta, she obtained the M D Lond in medicine in 1914 and the M R C P in 1920 During the war she was one of the civilian physicians attached to the Military Hospital, Endell Street, and medical officer to a T N T filling factory In 1915 she was appointed assistant physician to the South London Hospital for Women, and from 1926 to her death she was senior physician to that hospital After the war she became specially interested in functional nervous disorders, and for sixteen years was psychologist to Dr Barnardo's Girls Village Home Dr Thackrah's work in psychiatry was characterized by understanding and helpful kindness, she inspired great confidence in patients from every walk of life, her one consideration being whether she could give the help needed to overcome distress of mind

Our Paris correspondent informs us of the death of Dr AMEDEE MAURAT at Chantilly, near Paris, at the age of 90 He was the honorary president and a member of the executive committee of the Sou Medical, the most important philanthropic co operative organization for self defence in the French medical profession

Medical Notes in Parliament

The House of Commons reassembled on January 19, and that day discussed Empire migration and foreign affairs

The return of visits made by the Commissioners in Lunacy for the six months ended December 31, 1936, was laid on the table of the House on January 19

Silicosis

Replying to Mr J Griffiths on January 19, Mr LLOYD said that during 1936 there were 552 applications for certificates of disablement received by the medical board under the Various Industries (Silicosis) Schemes from among coal miners in South Wales Certificates were granted in 268 cases and refused in 253 cases 311 of the applications were from anthracite miners of whom 182 were certified and 115 refused Mr GRIFFITHS asked if Mr Lloyd was not aware that these men who had been refused certificates were all disabled in consequence of having inhaled dust in their occupation He asked if the Government proposed to bring forward a measure to give elementary justice to men who had laid down their lives for their work

Mr LLOYD said that the fact that a man was not certified under this procedure did not necessarily prove that he suffered from an occupational form of respiratory disease He might be only suffering from a form of respiratory disease which might not be due to his employment The Pulmonary Diseases Subcommittee of the Council recently held a meeting and decided that in the first instance it must come to a conclusion about the essential nature of diseases other than silicosis, from which miners suffered As a result they had arranged for clinical and radiological tests on the subject

Malnutrition in Monmouthshire

Mr SHAKESPEARE informed Mr Johnston on January 19 that his attention had been called to the physical condition of children in the boys school at Blaina He could not fully accept the head master's statement that 50 per cent of his pupils were undersized and underfed, poorly clad and badly

weeks in a year, while the number of persons sick reached the huge total of 395 000 Under the Unemployment Insurance Act of 1934 there was power to arrange for and compel attendance at physical training classes for the unemployed but these powers were not being used Young men were loafing around the street corners with their hands in their pockets and they had not the instinct of physical fitness In order to create this there must be a thirst for physical fitness at an early age Some people would rather that a man should be unfit than that he should become fit with the possibility of ever being called upon for patriotic service There was a contrast with Germany where 400 000 recruits of the 1920 class were called up and 80 per cent of these had been found fit for front line service Germany with her system of physical training was therefore passing four recruits out of five as compared with the rejection of two out of three in this country Professor Lelean urged that more playing fields should be provided and suggested that national physique might be improved by making it a condition for drawing unemployment pay that young men should attend summer camps for six months

Maternity Work in Glasgow

The medical report for 1935 of the Glasgow Royal Maternity and Women's Hospital is lucid and informative reflecting credit on its compiler Dr M D Black the registrar This institution is the largest purely maternity hospital in the country Of its 175 beds seventy eight are reserved for ante natal and seventy eight for lying in patients Nineteen beds are set aside in a separate isolation block for suspect cases Each of the assistant obstetric surgeons takes charge of this block for a period of four months and during his tenure of this office he has no dealings with patients in other parts of the hospital. The same restriction applies to the special house-surgeon who works under him The hospital treats a large number of abnormal cases totalling 68 5 per cent of all admissions in the year under review This is attributed in part to the high incidence of rickets in the population served by the institution In classifying cases it is stated that the simple division into booked ' cases and emergencies as suggested by the committee of the Royal Society of Medicine is not easily applicable at this hospital The scheme has therefore been modified, and indoor patients are divided into Category A, comprising those who were under ante natal supervision at the hospital clinic and who had attended on at least two occasions shortly before admission, and Category B, including all other patients 57 7 per cent of admissions during the year belonged to the latter category It is stated that a considerable amount of research work on infections of the urinary tract puerperal fever, and the toxaemias of pregnancy is being carried out by members of the medical staff

---

B Frattini (*Arch Ist biochim ital* October 1936 p 251) has studied the preventive and curative action in experimental infection of rabbits with a Type II pneumococcus of fractions of the products of autolysis of the bacterium concerned A product of prolonged autolysis from which the pyrogenic factors have been excluded by dialysis was found extremely active in experimental infections of rabbits leading to recovery in 96 6 per cent of animals which had received an injection of a culture which was otherwise lethal within twenty four to forty eight hours There was no pyrexia It would seem that the curative action of the injection was due to destruction of bacterial virulence pneumococci isolated by blood culture from the surviving animals were avirulent for others but the blood of the former contained no protective antibodies The protective fraction of the dialysate seemed to be specific one prepared from staphylococci was ineffective in treatment of pneumococcal infections

Correspondence

Nutritional Anaemia in the East End of London

SIR—I welcome the criticism by Dr Helen Mackay (January 16 p 140) of my communication on haemoglobin and red cell estimations in children not only because Dr Mackay has done so much work on the same subject herself but also because her own observations were made in children resident in the East End of London

Regarding the technique employed for obtaining the blood I may say that a sharp lancet shaped Hagedorn needle was used so that a satisfactory incision with a free flow of blood resulted It may be for this reason that I personally have never obtained the great differences between blood from ear and heel punctures recorded by Drucker and apparently also observed by Dr Mackay For the most part the differences I have observed have been within the range of experimental error Moreover if such a variation in the haemoglobin content of the ear blood as Dr Mackay suggests was a common feature, I should have expected a much wider spread of the individual estimations than is revealed in the curve A really wide spread of the estimations was only observed during the first few months of life

Dr Mackay raises the further question of the standard of normality which I have taken I venture to think that the more rational standard is the level present in the average healthy child and not the highest level to which the haemoglobin can be forced by artificial means I might say in passing that I have found it very difficult to increase the haemoglobin content of the healthy child by the administration of iron In any case it seems to me that the admission of such a principle not only implies that nature does not know how to provide for the needs of the growing infant since Dr Mackay considers the haemoglobin content even of the breast fed child unduly low but it would necessitate a reconsideration of the normal standard of other substances in the blood—for, example calcium

And finally whether or not the height of the haemoglobin is a measure of the resistance of the individual I think there can be no doubt that it is not a measure of the health of the individual I always remember that many years ago when I was studying the blood in rickets, I found that the rachitic children on the average gave definitely higher readings of both haemoglobin and red cells than were obtained in my own and my colleagues healthy and very often rosy cheeked children who were used as controls—I am etc

London W 1 Jan 16 LEONARD FINDLAY

Appendicostomy in Acute Appendicitis

SIR—For some years past when performing appendicectomy in cases where much peritonitis was present I have adopted the simple expedient of inserting a rubber catheter through the base of the amputated appendix and fixing it into the caecum by a purse string suture It does not add appreciably to the time taken for the operation and it usually enables one to dispense with a drain Any pus which subsequently forms will readily escape from the wound alongside the catheter Glucose and saline solution is administered by the slow-drip method and is rapidly absorbed from the large bowel

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL B M A House Tavistock Square W C 1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone, unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House, Tavistock Square, W C 1, on receipt of proofs Authors overseas should indicate on MSS if reprints are required as proofs are not sent abroad

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111

The TELEGRAPHIC ADDRESSES are
EDITOR OF THE *BRITISH MEDICAL JOURNAL* *Autology Westcent London*
FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements etc) *Articulate Westcent London*
MEDICAL SECRETARY, *Medisecra Westcent London*

The address of the B M A Scottish Office is 7 Drumsheugh Gardens Edinburgh (telegrams *Associate Edinburgh* telephone 24361 Edinburgh) and of the Office of the Irish Free State Medical Union (I M A and B M A), 18 Kildare Street, Dublin (telegrams *Bacillus Dublin*, telephone 62550 Dublin)

QUERIES AND ANSWERS

Dermatitis of the Feet

"H A" writes A young healthy girl of 17, brilliant at athletics and games is incapacitated from taking part in these hobbies for long stretches because she gets attacks of acute eczema of the feet after a short run or game in rubber-soled shoes I wonder if any reader could tell me of a sports shoe with a rope or other sole not likely to bring on this annoying trouble

Income Tax

Deduction for Board etc

"J F" is entitled under his agreement of service to a gross salary of £500 from which, however, £150 is deducted for board, washing and laundry In many cases similar appointments elsewhere are held on terms that the M O is entitled to £350 salary, plus board, etc which is valued at £150 Such M O s are in effect receiving the same total consideration as 'J F" but pay tax on £350 only, whereas he is assessed on £500 Is that correct?

*** Yes The question was decided by the Court of Appeal in 1926 in the test case of Machon *v* McLoughlin The underlying consideration is that, normally, remuneration received in a form which is not convertible into money is not taxable, and consequently, where the total remuneration consists of a salary plus advantages of that nature, only the amount of the salary is taxable Consequently M O s receiving £350, plus board, etc, are in a favourable position as compared with other salaried taxpayers Unfortunately for J F ' and others similarly placed the case quoted above decided that a deduction from a gross salary for board, etc did not have any effect for income tax purposes, and he is therefore chargeable on the full £500

Assessment

"LONICERA was appointed medical superintendent at a salary of £1 200 from October, 1935, previously he had been deputy medical superintendent at a salary of £800 He has been assessed for 1936-7 at £1 200—instead of £1,000 on the basis of his 1935-6 earnings—on the ground that as from October 1935 he held a new appointment Is that correct?

*** The assessment appears to be legally justified by Section 45 (4) of the Finance Act of 1927, which provides for assessment on the current year s basis where the person first held the office or employment in the year preceding It is we think correct to say that as from October, 1935, our correspondent held a new office" and that justifies, in law the application for 1936-7 of the current year s basis We believe however that the provision is not in fact applied when the change in the nature of the appointment is comparatively small, and 'Lonicera" might write to the Board of Inland Revenue, Somerset House, W C 2, stating the facts and asking for reconsideration of the proposed charge

LETTERS, NOTES, ETC.

Drug Treatment of Influenza

Dr JOHN T MACLACHLAN (Dornoch) writes For many years I have found that 20 grains of sodium salicylate every two hours for five or six doses brought all my influenza cases to an end in twenty-four hours This treatment is similar to that employed in the early stages of rheumatic fever But that treatment is useless in pneumonia, which is often confused with influenza Indeed if the sodium salicylate treatment in the above doses does not correct the influenza the probability is the case is one of pneumonia By influenza I mean a disease that starts suddenly with a severe headache, an abrupt rise of temperature and very severe myalgic pains all over the body, particularly affecting the muscles of the back, which are extremely tender to pressure with the finger, so that the patient starts suddenly on pressing the muscles in the neighbourhood of the scapula For women the dose should be 10 to 15 grains English people in my experience are more sensitive to drugs than the Scottish so that the appropriate dose for them is 15 grains for a man and 10 grains for a woman

Too Much Zeal

An overworked medical man practising in a northern suburb of London sends us a telegram which was delivered to his house at 7 20 a m one day last week The purpose of this message signed by a firm of manufacturing chemists was to recommend strongly one of their products "for personal protection and that of patients in present flu epidemic Our correspondent remarks ' It is to be hoped that the proprietors of the article therein advertised will soon realize that a medical man at a busy time like the present is more likely to resent than to appreciate this new method of forcing their wares on his attention The same complaint reaches us from other readers

An Insulin Booklet

Boots Pure Drug Co Ltd have issued a new and revised edition of their booklet on insulin in the treatment of diabetes mellitus Part I deals with the history and properties of insulin, and a description is given of the preparation, testing, and standardization of Messrs Boots product Part II deals with the diagnosis and treatment of diabetes, and contains the line ration diet scheme Particulars are also given for carrying out urine sugar tests tests for ketones, and a glucose tolerance test The booklet concludes with references to the more recent papers and books relating to insulin therapy Copies may be had on application to the Wholesale and Export Department, Boots Pure Drug Co Ltd, Station Street, Nottingham

Dr Barell's Festschrift

With reference to our review, headed "Modern Drugs' (December 26, 1936, p 1310) of the *Festschrift* published in honour of Dr E C Barell s forty years' service to Messrs Hoffmann-La Roche we are asked to say that a few copies of this book are available for the libraries of medical schools and societies They can be obtained on application to Roche Products Ltd, 51, Bowes Road, N13, so long as the supply lasts

A Warning

We are informed that a man in London is passing himself off as a doctor, forging cheques, signing IOUs, and borrowing money from medical men, dentists and chemists Medical men are warned against this impostor, and if approached by him should communicate with the police

Corrections

The obituary notice of Sir David Semple published last week said that he was assistant professor of pathology at Netley in 1904–9 This should have been *1894–9* Sir David retired from the R A M C in 1903, and in 1904-9 was working under the Indian Government at Kasauli

On January 16, at page 145 we published a letter from Dr W H Gossip on the further progress of the patient about whom he wrote in the *Journal* of January 9 (p 69) In Dr Gossip s letter "She has had 'fits'" should have read "She has had *no* 'fits'"

a multiplication by three which alters a proportion from *18 2* to *54 2*, and (2) stated definite odds based on assumptions regarding the patients (about half of the total) who did not reply My error, therefore lay in not attributing the discrepancy to the causes (1) and (2) Mr Tumarkin gives three reasons for (1), two of which have been discussed above The remaining reason, a desire to avoid confusing the article with mathematics appears hardly valid when two lines of his letter sufficiently indicate the nature of the alteration As regards (2) however reasonable it may be to suppose that the majority of the patients who did not reply were cured it is not legitimate from all the intrinsic and extrinsic evidence to make anything more than a general statement such as given above regarding the change in odds that might be expected if all patients had replied The reason for the lack of validity of the statement of odds lies deeper therefore, than a mere technical error Unwarranted precision is often dangerous to an observer himself and more often to others, in spite of an author's warnings about tentative results Any survey of medical literature shows that this is no academic or imaginary danger

Unlike a number of readers who have written to me regarding my article Mr Tumarkin seems to have misunderstood the purpose principles methods and results of the last three quarters of it My endeavour was to show that whenever one has a sample from which odds (or a ratio or chances) can be estimated it is possible to answer the question How often would such a sample arise by chance (unbiased sampling) if the true odds were for example, 2 to 1, or any other value apparently very different from the value suggested by the sample? The answer based on common knowledge of the effects of chance helps to arm an observer against the fatal tendency of figures to speak for themselves Rule of thumb in using any tool or method is dangerous and to show the validity and meaning of the standard deviation test there was introduced the mathematics to which Mr Tumarkin is probably referring when he speaks of the most imposing methods The standard deviation test itself, which occupies about one line of foolscap can hardly be so called In this demonstration some of Mr Tumarkin's figures were used with the preliminary statement 'It will be assumed that all such detectable influences [that is, those that cause bias] have been ruled out Bias due to failure of patients to answer questionaries is so obvious that it was not specifically mentioned The results therefore cannot be justly called completely misleading figures and in whatever form Mr Tumarkin's or other data had been used they would have served equally well as a demonstration of the misleading nature of odds estimated from samples without allowance for chance

Mr Tumarkin states that the application of rigorous mathematical methods to the tentative results of an experimental science is still a subject of discussion even among mathematicians themselves Opinions applicable to biology of which medicine is a branch are not necessarily obtainable from pure mathematicians (or even from those workers in biology and medicine whose outlook is that of the pure chemist or pure physicist) but from workers who are familiar with the methods and results of using quantitative methods in biology Moreover, when criticisms are heard it is important to avoid the easy confusion between two types of mathematical procedures (1) The demonstration such as discussed above of the extent to which chance, acting alone in a certain set of conditions could account for the result found in an actual sample This procedure, when properly understood, will be seen to be indisputably valid and in such tests as the standard deviation is not rigorous, nor does it overlook the warning against over precision It ceases when it has answered the question put to it leaving the observer to decide whether for him chance could sufficiently account for the result, or whether some other factor was likely to be responsible—for example the factor under investigation or even some hitherto undetected bias in the sample (2) The argument from a given sample to the material that it represents—for example, the estimation of the healthy average blood cholesterol value and normal range from a sample of a dozen people Considerable knowledge of the type of material under investigation is necessary in such estimates and here also medical literature shows that in many cases if suitable statistical methods had been applied they would have warned against a precision which later investigations have shown to be unwarranted

Finally, Mr Tumarkin says that further cases continue to confirm his figures Presumably of course this is not stated as an argument against knowing at an early stage of an investigation how much or how little precision is warranted at that stage—I am, etc

London W 1 Jan 18 GEORGE GRAHAM

Weight and Early Diagnosis

SIR,—At the present time when the early diagnosis of disease is being so urgently stressed may I enter a plea for regular weekly weighing as an important adjunct in discovering the beginnings of serious organic disease It is well known that some of our most deadly diseases such as cancer tuberculosis and diabetes invariably start with an insidious slight loss of weight long before other clinical symptoms have manifested themselves If free facilities throughout the country were afforded by the authorities concerned for the provision and use of weighing machines frequently supervised the public would soon become 'weight conscious Should the scales indicate an apparently symptomless loss of weight the patient could then immediately report to his doctor when steps could be taken for a full clinical or laboratory investigation It is still unhappily rare in general practice to see an internal case of cancer of less than six months duration and progressive loss of weight has often not been observed by the patient in the very early stages

The knowledge by the public that accurate scales were provided free of charge for the benefit of their health would soon lead to their regular use and help to bring to our notice early disease in its curable stage—I am etc

Sheffield Jan 11 ALFRED A MASSER M B Ch B

cent from this cause alone The ages of these sixteen patients, ten of whom were men, ranged from 39 to 65 With regard to the therapeutic lessons to be extracted from his analysis the author ventures the opinion that when a suppurative peritonitis is localized and in the early stage of abscess formation conservative treatment with opium is preferable to an immediate operation But it is difficult to define such a condition clinically When this can be done and conservative treatment is instituted, it seems probable that the mortality will be reduced

60 Intermittent Claudication

A HUSTIN (*Scalpel* Liege, November 28 1936, p 2409) describes the sudden pain and cramp which in cases of intermittent claudication of the leg arrest movement It has usually been considered that there are two causes of the condition, one permanent—namely arteritis of the main vessel of the limb—and the other transitory—namely, spasm of the arteries of the leg and foot Arteriography *shows in all cases a varying degree of occlusion* of the main vessels Hydrodynamic experiments have been carried out and investigations made under spinal anaesthesia in order to study the pathology of intermittent claudication As a result it has been ascertained that when the popliteal artery is of normal size any increase in size of the vessels of the thigh and leg leads to increase of fluid circulating in the thigh and leg This is seen in a normal subject during spinal anaesthesia If the size of the popliteal artery is reduced the same increase in size of the thigh and leg vessels brings about an increase of fluid in the thigh and a decrease in the leg This was observed during spinal anaesthesia in persons suffering from arteritis obliterans affecting the popliteal artery This disproportion is increased if there is further reduction of the calibre of the popliteal artery and also of the femoral artery It is suggested that ischaemia of the leg may occur, independently of spasm, by the simple dilatation of all the vessels of the lower limb, assuming that the arteries which feed the leg have an insufficient flow Narrowing of the popliteal artery and vasodilatation of the leg are the two conditions present in cases of intermittent claudication The patient is suffering from arteritis obliterans, and in the process of walking the size of the vessels is greatly increased and the intermittent claudication is brought about not by arterial spasm but by the dilatation of the arteries of the leg, which causes ischaemia Contraction of the muscles during walking results in dilatation of the vessels, the greater part of the blood being in the thigh, with a lessening of the quantity in the leg and a consequent pallor and loss of heat in the foot After rest the vessels resume their normal size and circulation is restored with the disappearance of symptoms It is suggested that many vascular disorders, such as angina, may be due to an irregular blood supply rather than to arterial spasm

61 Angioma of the Kidney

TREAHY and WELTON-HOGG (*N Zealand med J* October, 1936, p 294) report a case of angioma of the right kidney pyramid in a woman aged 33 years Having previously complained of lassitude and of albuminuria in her pregnancies several years previously, she was found in March, 1936, to be prostrated with severe shock following haematuria and pain of a few days' duration, and was admitted to hospital She showed evidence of internal haemorrhage, with tenderness and rigidity in the right renal area extending anteriorly to the pubis external to the rectus muscle On straight x-ray there was no evidence of calculi, but the renal outline was enlarged Cystoscopy showed a normal bladder mucosa and left ureteric orifice, the right being occluded with black clot, only 6 c cm of medium could be injected without pain There was distortion of the pelvis and ureter, only the lowest calix being filled A blood examination excluded disease of the haemopoietic system Right nephrectomy was performed and the kidney pelvis was found dilated with a large quantity of blood clot, the subepithelial tissue being engorged and oedematous At the tip of one pyramid was a cavernous angioma the size of a pea In nine of the twenty-seven cases reported mottling of the calices was described which in the opinion of Treahy and Hogg is due to the blood clot Accurate pre operative diagnosis appears to be impossible and nephrectomy seems to be the only treatment, although diathermy of the angioma was attempted in one case with success

Therapeutics

62 Malarial Splenomegaly

U DE NEGRI (*Policlinico* Sez Prat, November 30, 1936, p 2158) has employed the method introduced by Maurizio Ascoli in 1932 for the treatment of malarial splenomegaly, which consists in daily intravenous injections of very small quantities of adrenaline, the doses ranging from 1/100 mg to 1/10 mg for a period of thirty to forty days In the seven cases in which he employed the method the splenomegaly was reduced to the following extent in five cases by 3 to 4 cm and in two cases by 2 cm The method is said to possess economic and social advantages, and can well be substituted for much longer and more expensive forms of treatment

63 Autogenous Alimentary Poisoning

Reviewing the ways in which poisons are produced in the alimentary canal during normal and abnormal digestive and absorptive activities, M LOEPER (*Presse med* October 31, 1936, p 1705) draws practical therapeutic conclusions relating to the elimination of food residues in the mid intestine, the stimulation of the hepatic function, and the correction of faulty reactions of the intestinal contents He distinguishes three clinical syndromes miosis, hypotension salivation, sweating, and cramps in the calves, hypertension, mydriasis, dryness of the skin and mouth headache, and tachycardia, and a rather anomalous group of symptoms comprising miosis and salivation accompanying tachycardia, and mydriasis associated with sweating and bradycardia The chemical and bacteriological changes underlying these phenomena are discussed in detail, with especial reference to the products of protein digestion and the effects of the action of *B coli* on such products in fluid media of various degrees of acidity The author attributes more importance, however, to the effects induced by *B pyocyaneus B proteus*, and *B putrificus* and to the symptoms which can be traced to the presence in excess of histamine and tyramine He indicates the value of dietary control and of the administration of hydrochloric acid and pepsin, with which peptone may often be profitably associated Giving sugar or peptone before a meal promotes leucopedesis with anti-bacterial action, and this is intensified by the concurrent secretion of mucus The exhibition of pancreatic extracts reduces the amount of food residues incompletely digested Bacterial multiplication can be reduced by giving iodol and chloramine as well as carbon, which also fixes and neutralizes certain toxins Kaolin and paraffin diminish the permeability of the intestinal wall to some of these toxins, though not to the amino bases Sodium salicylate and hyposulphite with Vichy water and sodium sulphate aid the hepatic function Intradermal tests will indicate an undue sensitivity to histamine Desensitization measures can be taken when indicated, and in some cases alkalinization can be effected by administering sodium bicarbonate, chalk, and magnesia Loeper urges the importance of more exact determination of the aetiology of digestive disorders before treatment is instituted He recognizes the clinical significance of conditions of alimentary anaphylaxis of various kinds and suggests that further investigations in this direction would be profitable

mately one quarter of a pound sterling equivalent in the currency of their country The accepted languages are French, German English —I am, etc,

Respiratory Poisons

SIR—May I refer to Dr J A Goodfellow's very interesting letter in your issue of January 9 (p 95) concerning the widely variant effect of silica particles in causing silicosis, (*a*) when coal dust is also present and (*b*) when coal dust is absent Supposing it a true explanation that the divergence of incidence of silicosis in the two cases is that in the case of (*a*) the incisions in the tissues made by the sharp siliceous particles remain uninfected because of the antiseptic effect of the coal particles this would seem to be a special case of the general, widely applied action of carbon particles in powerfully absorbing or adsorbing other matter in the finest state of division

I use the term respiratory poisons to cover noxious gases or fumes, biological units—for example, bacteria moving through the breathable atmosphere, any such bacteria resident in the lungs and organic or inorganic particles such as silica And the modes in which these can become incident are (1) breathing of poisonous gases or fumes together with air otherwise impure, or (2) breathing such gases or fumes or otherwise impure air, independently

It will be realized that there is a whole string or succession of such respiratory poisons at all times, varying in incidence, severity and persistence and that those not subjected to one are to some extent subjected to another be it ever so mildly and that in fact, the excellent picture which Dr Goodfellow paints is really, as it were, the last scene in the play, where two specific inhalations only—namely, coal dust and silica dust—are the chief consideration At the other end of the string or succession of variegated breathable poisons may be considered the vile poison gases which are being projected into or prepared for, human lungs in war (civil or international) or industrial strife As regards prevention, the stage here shifts from inside to outside the lungs, and we find again that just as coal (carbon) particles were a valuable internal preventive against bacterial poisoning made otherwise likely by fine silica dust particles, so carbon particles are now a valuable external preventive against poisoning made otherwise likely by still finer noxious gas particles or molecules The coincidence of action of the coal or carbon particles in the two remote cases is too striking to miss but the implications of the action of carbon particles in respect to bacterial or other respiratory poisons is by no means confined to the remote extremes of the respiratory poison precession

For in between these extreme cases—both beneficent—of the powerful action of carbon particles is a vast field contrasted with which they are relatively insignificant where they operate not only in the relatively isolated cases of sufferers from silicosis and war gases—terrible and wide as those may be—but on all members of the community without exception at all times Throughout this vast general field of respiratory poisoning the carbon particles —again the chief element—have shed their benign role and adopted the sinister one held by the silica particles in the case of silicosis This however is not because their operation is not the same—that is adsorption of other finely divided particles—but because they are adsorbing materials which are external to the lungs before carrying them there rather than material already in the lungs

The carbon particles in this central case of vast incidence are those innumerable soot particles which largely comprise atmospheric pollution and are presented to all our lungs as either fogs or dry filth dependent on humidity and temperature conditions T McLachlan[1] has insisted on the rather ignored probability of the biological and bacterial aspect of atmospheric pollution He maintains in fact that the air is a soil which is fertilized by the by products of combustion and the residue of animal and vegetable offal which are distributed throughout the air, and I myself have also considered this viewpoint

The string or succession of the above respiratory poisons can be summarized

Field of Application	Human Incidence	Nature of Carbon	Action of Carbon	Effect of Carbon
Silicosis victims	Internal to lungs	Coal particles	Adsorbent and antiseptic	Beneficial
Poison gases (peace or war)	External (excluded)	Carbon	Adsorbent and antitoxic	Beneficial
Atmospheric pollution	External (inhaled)	Soot	Adsorbent and eptic	Noxious

In view of what I thus find is the almost inescapable conclusion that the adsorptive power of carbon (coal soot, or amorphous) is not merely an important chemical and physical fact of interest in isolated fields or cases but a reaction of wide general implication and application affecting the health welfare and prosperity of all I would like to be allowed to advance the following points for serious consideration and it is hoped prolonged research

1 How many bacteria or other biological units are adsorbed nourished increased and introduced persistently as respiratory poisons by atmospheric carbon particles? Is this for example how an influenza epidemic is promoted and spread?

2 Does the adsorptive power of carbon particles for gases (*a*) take up nitrogen and oxygen in atmospheric proportions from the atmosphere thus leaving their atmospheric mixture unvaried or (*b*) does it adsorb proportionately more oxygen than nitrogen thus devitalizing the atmosphere as well as poisoning it?

3 If the carbon particles adsorbed proportionately more nitrogen atmospheric pollution would produce exhilaration as ozonized sea air does

4 Does the atmospheric pollution which robs us of roughly 50 per cent sunshine and ultra violet rays in a count where 100 per cent would not be too much also in addition to harbouring and increasing bacterial life for our inspiration prevent *per se* the destruction of even such bacteria as would be air borne if such pollution were absent due to the 50 per cent reduction of sunlight bactericidal action?

I feel sure Sir that these will be realized as questions of vital importance and of pressing concern for the whole community showing that the dread silicosis is but an intense though isolated field of the quite general respiratory poisoning which calls urgently in *all* its phases for a campaign of extermination at any cost For respiratory poisoning is perhaps the greatest reality of atmospheric pollution whether seen from the biological or the non biological angle and the possible oxygen depletion in respiratory poisoning is a most serious factor which if established would demand urgent national measures to ensure the complete cessation of atmospheric pollution—I am etc,

S C BLACKETT

Obstetrics and Gynaecology

68 Beri-beri and Hyperemesis Gravidarum

F WIDENBAUER (*Med Welt* December 5, 1936 p 1772) describes symptoms suggestive of beri-beri in a case of hyperemesis gravidarum The patient aged 27, was three months pregnant (third pregnancy) For a month she had had hyperemesis, with nausea and anorexia Her food intake was quite insufficient and she lost weight Later she complained of nervousness, lassitude and insomnia Dyspnoea occurred on slight exertion with precordial pain and heavy sweats, there were paraesthesiæ, especially in the lower extremities For three years she had suffered from slight attacks of diarrhoea twice a year The blood pressure was 100/70, otherwise the physical examination was entirely negative The author regarded this as a case of B_1 hypovitaminosis and after an injection intramuscularly of vitamin B_1 all symptoms cleared up in twelve to twenty-four hours with the exception of the hyperemesis, which continued for a few days in a mild form Hypovitaminosis is due to several factors (1) lessened intake—in this patient the hyperemesis gave rise to loss of weight from lack of nourishment (2) impaired bowel absorption—the probability of this factor arises from a consideration of the attacks of diarrhoea in the past three years, (3) increased requirements—in pregnancy the vitamin B_1 requirements increase fourfold to fivefold, (4) disturbance of correlation with regard to other vitamins In this particular patient tests of her ability to excrete vitamin C were carried out prior to pregnancy and during it It could be shown that there existed a severe discrepancy between the increased vitamin requirements during pregnancy and the disturbed food and vitamin intake produced by the hyperemesis Widenbauer believes that the B_1 hypovitaminosis might have been accentuated by the increased intake of vitamin C during the test, due to a true disturbance of correlation between vitamins B_1 and C He points out that similar cases, which are often put down to toxicosis should be treated with vitamin B_1 in order that the therapeutic value of this vitamin in the treatment of hyperemesis gravidarum may be thoroughly tested

69 Chorion Epithelioma

A VIGNALI (*Ann Ostet Ginec* October 31, 1936, p 1351) records two fatal cases in women aged 36 and 40, the former being an example of primary ectopic chorion epithelioma of the vagina, and the latter one of uterine chorion epithelioma which had developed in the course of amenorrhoea

Pathology

70 Dissociated Antigens from Vaccinia Elementary Bodies

J CRAIGIE and F O WISHART (*J exp Med* November, 1936 p 803) have shown that thermolabile and thermostable precipitable substances dissociate *in vitro* from elementary bodies of vaccinia that have been washed free from soluble precipitable substances and then kept in suspensions The washed elementary bodies yield the dissociated antigens in varying amounts and after repeated separation become exhausted of dissociable substances but remain highly infective The titre of the dissociated L antigen is about half that of the S titre The dissociated antigens are serologically related to the soluble precipitable substances found in suspensions of fresh vaccine pulp The thermolabile antigen is inactivated at 56° to 60° C whilst the thermostable one is stable up to 100° C Dissociation is not much affected by temperature until exhaustion point is approached, and occurs best at a *p*H of 7 to 8 Ether accelerates dissociation Formalin reduces the titre of the dissociated S antigen but does not affect the dissociated L antigen The dissociated antigens stimulate production of L and S antibodies but appear to be a complex LS antigen rather than two separate antigens Their significance and their source as to whether they are adsorbed on the elementary bodies or are liberated by disintegration of less resistant forms, are discussed

71 Alcohol Concentration in the Blood

O WILLIGAND (*Med Klinik* November 27, 1936, p 1632) has investigated the alcohol concentration in the blood of 175 persons involved in motor accidents Of these, 123 cases showed an alcohol concentration of 1 to 3·8 in 1,000 in the remaining fifty two cases the alcohol concentration in the blood was only below 1 in 1,000 down to the physiological content of 0·04 in 1 000 Therefore 70 per cent of all the cases involved in the accidents could be described as definitely under the influence of drink A noticeable increase in accidents always occurred on holidays such as Easter Whitsun, etc Whereas ten tests used to be carried out in about a month,-the number of tests for a single Easter Day amounted to twelve and of these nine showed an increased concentration of alcohol in the blood The author therefore concludes that alcohol plays an important part in the causation of accidents and advises stricter police control of drunkenness among motorists

72 The Frei Test

A W GRACE and F H SUSKIND (*J Amer med Ass* October 24, 1936 p 1359) discuss the use of standardized mouse-brain antigen in the Frei test and its advantages over human pus antigen They prepared mouse brain antigen by emulsifying in sterile physiological saline the brain of a mouse killed when moribund on the seventh day after inoculation with a standardized suspension of poradenitis venerea (lymphogranuloma inguinale) virus The emulsion was then diluted so that after heating to 60° C on two successive days 0·05 to 0·1 c.cm produced in lymphogranulomatous patients a papule of not less than 7 mm diameter Ninety-five specimens of antigens so prepared and forty-one commercial specimens of the mouse-brain antigen were tested on fifty patients with poradenitis venerea (171 tests) and on 128 normal persons (241 tests) Control tests (183 in number) were carried out on both groups of subjects with normal mouse brain antigen A typical positive reaction was obtained in every test with lympogranulomatous mouse-brain antigen in lymphogranuloma patients, the papule being never less than 7 mm diameter, and in 75 per cent was 7 to 10 mm All had a surrounding erythema In the tests on normal persons and in those with normal mouse brain antigen (424 tests) the papule was never as large as 7 mm diameter, and in 88·6 per cent was 1 to 4 mm and there was only slight erythema The difference between positive and control tests was thus readily recognizable Both lymphogranulomatous and normal mouse brain antigens were suitable for use after two years keeping Standardized lymphogranulomatous mouse brain antigen appears, therefore, to be the most suitable test material for diagnostic purposes, it should be used with normal mouse brain antigen as a control

73 Tuberculosis and Schizophrenia

G KRAUS J H PANNEKOEK, and E E P MEYJES (*Nederl Tijdschr Geneesk* October 10, 1936, p 4617) review the recent literature on the connexion between tuberculosis and schizophrenia, which shows that no convincing evidence has hitherto been brought forward that tuberculosis is the cause of this psychosis This conclusion is confirmed by the investigations of the authors, who inoculated sixty-five guinea-pigs with the cerebro spinal fluid from fifteen cases of schizophrenia None of the animals showed any naked-eye or microscopical evidence of tuberculosis at necropsy

assistant to the civil surgeon and acted on several occasions as *civil surgeon of the station* Before retirement he was given the Imperial Service Order He had been assistant surgeon to four Viceroys—Lords Hardinge Chelmsford Reading and Irwin He leaves a widow a son and two daughters

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

The Vice Chancellor gives notice that the Professorships of Zoology and Physiology and the William Wyse Professorship of Social Anthropology will become vacant on September 30 1937

D V Davies M B B S Lond and W R M Morton M D Belf have been appointed university demonstrators in the Department of Anatomy for three years from January 1, 1937

With the object of encouraging original medical research the Grocers Company offers annually three scholarships each of £300 a year tenable for one year and renewable for a further period of one or two years Candidates must be British subjects under 35 years of age Applications must be made before April 30 Forms of application may be obtained from the Clerk of the Company Grocers Hall Princes Street London E C 2 Further particulars may be seen at the University Registry

A series of lectures on the history of science open without fee to all members of the University or of Girton or Newnham Colleges will be given in the lecture room of the Physiological Laboratory at 5 p m on January 22 29 February 5 11 19 and 26 and March 5 and 11 The lecturers are Sir W C D Dampier Dr J Needham Mr J D Bernal Sir A S Eddington Dr H H Thomas Dr D McKie Professor R C Punnett and Professor A Ferguson

The title of the degree of B Chir was conferred during the month of December 1936 on M P Shackle (Newnham) and W Y Young (Girton)

Dr H A Harris Professor of Anatomy has been elected into a professorial Fellowship at St John's College and Dr G P McCullagh University Demonstrator of Pathology to a reserved Fellowship at Queen's College

UNIVERSITY OF LONDON

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

The following candidates have been approved at the examination indicated

POST GRADUATE DIPLOMA IN PUBLIC HEALTH—*Part I* J K Adramala D M Blair Kathleen G Brimelow Joyce M Brockington P N Chatterjee A B Christie Kitty K Conrad J S Cookson Teresa I M Craig Iris M Cullum C F Cummes B K De Silva S Graham Eva M Gray H F Green R M M Hunter J D Lendrum S E D Masilamani B B Mukerjee D Murray A F S Perera Violet M Spiller Tsung Sing Sze J W P Thompson A F Turner H M van der Wall Sarah C B Walker L A F Wiles Isabel A M Woods

UNIVERSITY OF LEEDS

Appointment of Readers in Medicine and Surgery

On the recommendation of the Board of the Faculty of Medicine the Council of the University has advertised for Readers in Medicine and Surgery Those who are appointed will have to devote all their time to the duties of the posts and the salaries are fixed at £600 per annum Without its being made an absolute condition it is mentioned as desirable that candidates for the medical and surgical posts respectively should have the Membership of the Royal College of Physicians of London or the Fellowship of the Royal College of Surgeons of England and should not be more than 35 years of age Application has been made by the University to the Board of Management of the General Infirmary that facilities should be afforded to these two officers to carry out certain of their duties within its walls and this has been readily granted In general terms it may be stated that the duties of the posts will be mainly those concerned with research in medicine and surgery under the direction of the professors of those subjects and it is hoped that the correlation of clinical and laboratory investigations will receive special attention Those who are appointed will take an important part in the teaching of the two subjects

UNIVERSITY OF ABERDEEN

The King on the recommendation of the Secretary of State for Scotland has approved the appointment of Dr John Stirling Young professor of pathology in the Queen's University Belfast to be Regius Professor of Pathology in the University of Aberdeen in the place of Profes or Theodore Shennan resigned

ROYAL COLLEGE OF SURGEONS OF ENGLAND

At a meeting of the Council of the College held on January 14 with Sir Cuthbert Wallace the President in the chair the death of Sir John Bland Sutton Bt was reported and a resolution of condolence was passed

Sir Cuthbert Wallace was appointed to represent the College at the Coronation ceremony Dr John Beattie on the Hunterian Memorial Lecture Committee Sir Arthur Keith on the Joint Committee of Anthropological Research and Teaching Mr Eardley Holland on the Central Midwives Board and Mr L R Braithwaite *on the Medical Advisory Committee* of the British Health Resorts Association

The Council agreed to enter into a contract for the rebuilding of the upper floors of the College as the Bernhard Baron Research Laboratories

The best thanks of the Council were given to Lord Moynihan for the gift of the instruments used by the late Lord Moynihan

A cheque for £25 was received from Mr Walter Radcliffe M R C S for the specific purpose of cancer research and the best thanks of the Council were given him for his gift

A diploma of Fellowship was granted to R G Worcester and a diploma of Membership to B J Green

The following diplomas were granted jointly with the Royal College of Physicians

DIPLOMA IN PUBLIC HEALTH—R M Campbell A B Donald P J Doody M S A Hamid Enid A Hughes Vida L Liddell C Muir K Somaskandar H E Stevens

DIPLOMA IN PSYCHOLOGICAL MEDICINE—K C Bailey B P Bhattacharjya C M Carlyle Gill L A Collins J G Dewan D S Fairweather H Gillies Lilian A Hayward B H Kirman E H Kitching A R McPherson M L Meade King T A Ratcliffe D E Sands W W Sargant A S Thorley D B Wyatt

DIPLOMA IN LARYNGOLOGY AND OTOLOGY—D L Brown C V Dixon N Dutt G A Jamieson R N Misra

The following hospital with the post specified was approved for recognition for the six months surgical practice required of candidates for the final Fellowship examination The Cheltenham General and Eye Hospitals (house surgeon at the General Hospital)

VITAL STATISTICS FOR ENGLAND AND WALES, 1936

We are indebted to the Registrar General for the following statement regarding the provisional birth rates and death rates and the rates of infantile mortality in England and Wales and in certain parts of the country during 1936 The statement is issued for the information of medical officers of health

ENGLAND AND WALES

Birth Rate Death Rate and Infant Mortality for the Year 1936 (Provisional Figures)

	Rate per 1,000 Resident Population		Death under 1 Year per 1,000 Registered Live Births
	Live Births	Deaths Crude Rates	
England and Wales	14·8	12·1	59
122 county boroughs and great towns including London	14·9	12·3	63
143 smaller towns with the latest resident populations of from 25,000 to 50,000 at the 1931 Census	15·3	11·7	55
London (administrative county)	14·7	12·5	66

NOTE—The birth and death rates for England and Wales are calculated on the estimated mid 1936 population For purposes of comparison aggregates and for London are calculated on the basis of the census of 1931

The birth rate for 1936 of 14·8 is above that for 1935 and is the lowest recorded

The crude death rate of 12·1 is above that of 1935 and is the lowest on record

The infant mortality rate of 59 is above that of 1935 which was the lowest on record and is the same as that of 1934 the previous lowest

show that there is often a very definite family history of Addisonian or other anaemias Hunter wrote a series of articles for Allbutt and Rolleston's *System of Medicine* in the section on the liver and its function and disorders jaundice Weil's disease acute yellow atrophy phosphorus and chloroform poisoning and congestion The article on jaundice was a lengthy well arranged consideration of the various theories explaining the causation of obstructive and non obstructive varieties A good deal of his own studies on blood destruction was embodied in these articles He also wrote the articles on the treatment of anaemia and purpura in the *Index of Treatment* edited by Hutchison and Sherren

He became a member of the Royal College of Physicians in 1889 and was elected to the Fellowship seven years later He was an examiner at the College for a few years but took no other part in its activities He acted also as examiner for Cambridge and Glasgow Universities and received honorary degrees for his scientific work During the war he was in charge of a British mission to Serbia and in 1920 published an account of the epidemics of typhus and relapsing fever which occurred there He was also president from 1915 to 1917 of the Medical Advisory Committee for the Eastern Mediterranean and Mesopotamia Expeditionary Forces and later consulting physician to the Eastern Command with the temporary rank of colonel A M S For his services in the war he received the C B and a high Serbian decoration—that of Grand Officer in the Order of St Sava

Dr William Hunter joined the British Medical Association in 1887 he was honorary secretary of the Section of Pathology and Bacteriology at the Montreal Meeting in 1897 vice-president of the Section of Pathology at Exeter in 1907 and vice president of the Section of Medicine at Birmingham in 1911

Dr A W OXFORD writes

Charing Cross Hospital is lamenting the loss of its oldest consulting physician Dr William Hunter His first connexion with the hospital was before he was elected to the staff when he entered into controversy with Sir F W Mott on the subject of pernicious anaemia Mott used to assert that Hunter argued from one post-mortem on the disease, while he himself had performed three They became good friends, however soon afterwards when Hunter was elected assistant physician to Charing Cross Hospital, and each concentrated on special subjects and became famous

Hunter devoted his whole life to the hospital When he was made dean he entirely renovated the medical school which had been neglected for many years, and also classified the museum and wrote a catalogue When he was made in patient physician he carried out the same renovation in the medical wards which were dark and dingy compared with the surgical wards He also wrote a comprehensive history of the hospital and school He took a great interest in the students and was much valued by them as a clinical teacher Of his scientific work and his work during the war others can speak with far more knowledge but the love and admiration felt for him by his colleagues and old students was shown by a dinner given to him when the lapse of years compelled his retirement He always retained his interest in the hospital and until the last two months was regular at the meetings of the council He will be long remembered and regretted

[The photograph reproduced is by Vandyk 41 Buckingham Palace Road S W 1

J A MACWILLIAM M D LL D F R S

Emeritus Professor of Physiology University of Aberdeen

The death took place in an Edinburgh nursing home, on January 13, of Emeritus Professor John Alexander MacWilliam late of the chair of physiology at Aberdeen He was born in 1857 at Culmill and after a medical course at Aberdeen University graduated M B., C M in 1880, gaining the John Murray Medal In 1882 he took the M D degree with honours choosing as the subject of his thesis the cardiac muscular fibre in the various classes of the animal kingdom and the diaphragmatic fibre in various animals He studied for a time at the Universities of Edinburgh and Leipzig and at University College London where he acted as assistant to the professor of physiology For a time he was on the staff of Charing Cross Hospital Medical School London and lecturer on physiology in the London School of Medicine for Women

In 1886 MacWilliam was appointed professor of physiology at Aberdeen University in succession to Professor Stirling, and retired from that post in 1927 He had great qualities as a teacher and scientific investigator and his contributions to physiological knowledge were numerous including The Rhythm of the Mammalian Heart and The Phenomenon of Inhibition in the Mammalian Heart both published in the *Journal of Physiology* Estimation of Systolic and Diastolic Blood Pressure in *Heart* 1913 Blood Pressures in Man under Normal and Pathological Conditions in the *Physiological Review* 1925 and various other papers dealing with the action of chloroform and ether proteins muscle sound etc which appeared from time to time in the *Proceedings of the Royal Society* He was a Fellow of the Royal Society and in 1928 the University of Aberdeen conferred upon him the honorary degree of LL D He joined the British Medical Association in 1889 was vice president of the Section of Physiology at the Annual Meeting in 1898 and of the Section of Anatomy and Physiology in 1914 and president of the Section of Physiology in 1922

Professor MacWilliam's recreations were chiefly motoring and cycling and he had travelled widely in various parts of the world He was twice married and is survived by his widow

ARTHUR HUGH THOMPSON M D

Consulting Surgeon Western Ophthalmic Hospital

By the death at Hampstead on January 11 of Dr Hugh Thompson the profession has lost an accomplished ophthalmic surgeon and a man of attractive character He was born in 1859 being the youngest of the seven sons of Charles Thompson of Cardiff where his family held a good position Most of his early education was received at Grove House Tottenham whence he proceeded in 1878 to Trinity College Cambridge He had then no thought of a medical career but read history in which he took honours in 1882 A far finer achievement was his winning the senior Whewell scholarship in international law in 1880 After taking his degree he engaged in teaching and lecturing and was one of the earliest workers at Toynbee Hall under Canon Barnett It was then that he became convinced that medicine was the career in which he could best serve his generation From that conviction he never swerved For his first medical studies Thompson returned to Cambridge where he attended at Addenbrooke's Hospital and from there went on to the London Hospital He qualified as M R C S and L R C P in 1891 and the same year took the M B and B Ch degrees at Cambridge, the M D followed in 1900

Trade **FORMALGAR** Mark

Formerly known as Gargarisma Formalin Co (Hewlett's)

An excellent preparation containing Formalin, Glyc Acid Carbolic, Tinct Pyrethri, etc When diluted in the proportion of one drachm in eight ounces of water it forms an efficient Gargle for Infectious Sore Throat, etc, or an Antiseptic Mouth Wash

MEDICAL OPINIONS

'This is a most economical, efficient and pleasant Gargle and Mouth Wash It is highly concentrated one fluid drachm being sufficient for an eight ounce bottle It has been employed by dental surgeons for use after extractions, etc and is also suitable for general purposes —MEDICAL ANNUAL

Dr G H speaks very highly of Gargarisma Formalin Co used twice daily (Gargle—1 drachm to 8 oz water) for throat irritation in professional singers

I have tried your Gargarisma Formalin Co and find the patients like it —J W S I D S Eng

56 Light Reflex Test for Hypovitaminosis

G FRIDERICHSEN and C EDMUND (*Hospitalstidende* October 13, 1936 p 1081) have devised a test for measuring the reflex irritability of the eye to light in children under 2 years, and they claim that by this means the vitamin A balance of the organism can be expressed in quantitative terms The test consists in flashing a light on a child's eyes after it has been in the dark for at least half an hour the minimum reflexibile (m r) being the smallest light irritation capable of provoking certain reflex movements through the child's eyes These movements may consist of shutting of the eyes, wrinkling of the forehead and an upward movement of the eyebrows when the light comes from above Or the movements may be prompted by an oculomotor reflex the eyes moving very quickly in the direction of the source of light Or there may be other movements such as rotation of the head in the direction of the light or snatching at the light The authors have determined the limits within which the m r is normal and they show how a low m r may be associated with a diet deficient in vitamin A or with a defective absorption of this vitamin They also succeeded in restoring the m r to normal by the exhibition of vitamin A preparations The absorption of vitamin A from animal sources evidently takes place rapidly, for it was found that the m r could be restored to normal in half an hour by the administration of cod liver oil and other substances rich in vitamin A By means of this test it proved possible to express the comparative values of different vitamin A preparations accurately in terms of figures, and it was noted that 100 international units of a dried spinach preparation had the same effect on the m r as about 1 000 international units of a halibut liver oil extract It was also noted that with the return of the m r to normal under vitamin A medication there was a remarkable improvement in the children's psychic reactions, flabby lassitude giving place to lively smiles

57 Trauma in Leukaemia

P EMILE WEIL and J BOUSSER (*Ann de Med* October, 1936, p 220) discuss trauma as an aetiological factor in leukaemia with special reference to medico legal issues They point out that it is difficult to assess the part that trauma plays The initial period of myelogenous leukaemia is latent and insidious The clinical period lasts two to four years and even modern treatment leaves the ultimate fatal outcome uninfluenced The terminal stage may simulate acute leukaemia which has a prodromal stage lasting from two weeks to some months and a clinical stage lasting several weeks and ending in death Thirty eight cases of leukaemia (including four of their own) in which trauma played a part were critically studied They were divided into three groups The first group included all cases in which leukaemia was discovered following a general examination after some trauma Acute leukaemias are rarely found in this group The second group included cases of leukaemia aggravated by trauma either by the leukaemic condition deteriorating or because of grave injury to the spleen abundant haemorrhage or infection occurring It is noteworthy that surgical intervention is rarely required when an enlarged leukaemic spleen undergoes trauma Operation on leukaemics is often disastrous and should be avoided if possible The third group included those cases in which trauma appeared to have been the aetiological factor In medico legal cases the following points should be borne in mind (1) The statement that the patient was perfectly well until the accident is insufficient proof that the initial stage of leukaemia was not present prior to it, but this is possible (2) The exact history of the trauma must be ascertained noting especially whether the spleen or bone marrow was actually affected Experimental evidence shows that the bone marrow is a fragile tissue and may be damaged by simple trauma and that one such lesion is sometimes sufficient in certain animals to produce a typical leukaemia Leukaemia following damage to the spleen is much more difficult to prove (3) The period of latency following the trauma must be carefully ascertained In Germany symptoms occurring up to one year are deemed to be valid evidence of causation but the authors believe that this period should be extended to two and a half years (4) All data bearing on the blood picture and post mortem reports should be in possession of the expert Only myelogenous leukaemias can be considered as having been caused by trauma In assessing damages the expert must bear in mind that whether trauma has aggravated or actually produced leukaemia the condition is fatal in any case

58 Prognosis in Diabetes

H E BUTTNER (*Dtsch med Wschr* October 9 1936 p 1668) reports from the University Hospital in Giessen his experiences since 1924 with 539 cases of diabetes classified in different periods between 1924 and the beginning of 1936 He notes that as in other parts of Germany there has been in his hospital an appreciable rise during the last few years in the number of admissions of cases of diabetes and there has of late been no decline in the number of cases admitted in diabetic coma On the other hand his figures show an increase in the expectation of life of diabetics in the period under review In this connexion it may be noted that the improvement in economic conditions and in the medical care of those diabetics who require insulin has left its mark on the expectation of life An investigation at the beginning of 1936 of the cases treated in the three year period 1932–4 showed that 27 per cent of 211 patients were already dead The causes of death were ascertained in thirty two cases and it was found that the diabetes itself and diseases of the vascular system were each responsible for 37 5 per cent the remaining deaths being due to new growths and infections including tuberculosis

Surgery

59 Mortality from Appendicitis

H JENSENIUS (*Ugeskr Laeg* November 5 1936 p 1085) has analysed the 1 933 cases of acute appendicitis admitted to a Danish hospital during the past ten years Of the 1 592 patients who came to operation as many as 109 died —a mortality of 6 85 per cent Compared with American and other statistics with mortalities ranging from 2 to 3 per cent this result is disquieting and the author has indulged in some heart searching His comparatively high mortality may however reflect to a certain extent differences in classification all his cases were acute they all came to operation all the appendices were subjected to a histological examination and when this showed no sign of acute inflammation the case was not included in the analysis There were 105 such cases without a single death among them Of the 109 deaths more than half (fifty seven) were due to general peritonitis and in all together seventy two cases the cause of death was considered to be from the appendix There were as many as seven deaths from pulmonary embolism—a mortality of about 1 per

Laryngology

64 Ear Changes in Late Congenital Syphilis

O MAYER and J S FRASER (*J Laryng* November and December 1936 pp 683 and 755) have combined their anatomical material because histologically examined cases of deafness due to late congenital syphilis are extremely rare In such cases the hearing defect comes on fairly suddenly between the ages of 10 and 20 and progresses rapidly The ocular changes and dental deformities enable one to make a diagnosis The pathological changes affect chiefly the inner ear in the form of gummatous osteomyelitis of the labyrinth capsule The osteomyelitis often reaches the endosteum especially in the region of the semicircular canals All this tissue contains giant cells with necrosed particles of bone In the internal auditory meatus the osteomyelitis may extend as far as the dura with subdural gummata Perineuritis and atrophy of the eighth cranial nerve in the internal auditory meatus are often seen Pathological changes of the membranous labyrinth include dilatation of the ductus cochlearis atrophy of the organ of Corti and miliary gummata in the spiral organ The utricle and saccule may be much dilated and the lumen of one or other semicircular canal is frequently obliterated by new bone formation These changes are due to serous labyrinthitis either active or healed The external auditory meatus showed changes in two cases out of five—namely gummata in the meatal wall with bone necrosis and sequestration of a bony fragment This may give rise to secondary cholesteatoma invading the tympanic cavity The middle ear was unaffected in three out of the five cases In two the malleus and incus were ankylosed in the third there was a fibrous exudate in the tympanic cavity with a partially calcified tympanic membrane The special points in pathology which enable one to distinguish between syphilitic and tuberculous bone lesions are also fully discussed The monograph contains many illustrations of sections and several coloured plates

65 Chronic Pharyngeal Infections

H P SCHENCK (*Arch Otolaryng* Chicago September 1936 p 299) removed small portions of pharyngeal mucosa for biopsy in 108 patients who had pharyngeal complaints and symptoms usually attributed to focal sepsis—for example arthritis fibrositis chorea cervical adenitis pericarditis and kidney disease All these patients had undergone tonsillectomy previously but their symptoms had not been cured or had recurred In such patients when other obvious foci are missing the pharyngeal mucous membrane is often abnormal Symptoms which disappear after tonsillectomy often return as the pharyngeal lymphoid follicles in turn become infected and hypertrophic Exacerbations of systemic symptoms commonly follow acute infection of the pharynx and such symptoms may disappear after sufficient destruction of abnormal lymphoid nodules in the pharynx by electrocoagulation As a control small pieces of pharyngeal mucosa were removed from twenty normal persons ten adults and ten children and submitted to histological examination In the sections from the normal pharynges the lymphoid nodules were small they had few mitotic cells and the mucous glands occurred at a considerable depth The sections from the abnormal pharynges are described and illustrated in four groups according to certain systemic manifestations—chorea chronic myalgia nephrosis and low grade fever Histologically there was no specific alteration in the pharyngeal nodules in one type of disease which would differentiate them from the nodules occurring in another type of disease Marked hyperplasia with chronic inflammatory change was the rule as shown by proliferation of fibrous tissue and concentration of polymorphonuclear leucocytes in the lumen of the crypts The lymph nodes are prone to undergo rapid proliferation and show mitosis

66 Brain Abscess

J PIQUET and J MINNE (*Ann Oto laryng* October 1936 p 993) review a series of twenty two cases of brain abscess treated during the last fifteen years They recognize two distinct clinical types the diffuse encephalitis and the localized abscess with a capsule Among the twenty two cases were sixteen cerebral and six cerebellar abscesses Of the cerebral abscesses three were caused by frontal sinus suppuration one metastatic twelve cerebral abscesses and the six cerebellar ones were complications of middle ear suppuration The bacteria isolated from each case are described the infection being usually a mixed one When the streptococcus is the cause the type of abscess is frequently diffuse The volume of brain abscesses varies within wide limits between 5 and 120 c cm sometimes more In one case discovered at necropsy the abscess cavity occupied almost the whole of one cerebral hemisphere Secondary abscesses may be found at a distance from the primary abscess separated by cerebral substance which appears normal to the naked eye but is actually necrosed brain substance as can be shown histologically In one very exceptional case a frontal lobe abscess had formed a secondary abscess in the opposite hemisphere with a communication across the corpus callosum The cerebro spinal fluid is sometimes clear sometimes turbid According to the authors this has little bearing on the prognosis Localizing signs—for example aphasia—were found in only five out of the sixteen cerebral abscesses On the other hand all the cerebellar abscesses gave the cerebellar syndrome disturbed equilibrium, nystagmus adiadokokinesis Among the sixteen cerebral abscesses twelve were operated on with seven cures and there was one patient who survived for six months The fatal cases were practically all among the diffuse abscesses while the patients with localized abscesses generally recovered Three out of the six cases of cerebellar abscess were saved by operation

67 Pathogenic Fungi

E J WHALEN (*Arch Otolaryng* Chicago October 1936 p 436) makes a survey of the literature of fungus infections of the ear nose throat and respiratory tract The direct microscopical examination of the wet unstained specimen is recommended The material is placed on a slide and treated with a few drops of an alcoholic solution of sodium sulphide This clears the specimen of pus cells fibrin and exudate A special medium which retards the growth of bacteria is used for culturing fungi The first group are due to *Monilia* which cause thrush and also certain lesser infections of the bronchopulmonary system Sporotrichosis caused by a spore bearing fungus forms the next group The disease process is granulomatous and lesions are found in the skin mucous membranes and lungs Sporotrichosis is conveyed by infected plants or vegetable matter and the lesions tend to ulcerate with a cup like depression at the apex when it has become necrotic The term blastomycosis is used to describe another group of closely allied clinical conditions the fungus being a round highly refractile body containing granules of various sizes The cutaneous lesions are ragged superficial ulcers Blastomycosis of the tongue and of the larynx has been reported by Chevalier Jackson In actinomycosis the parasites are found in the pollen or the chaff from grain stalks and the infection occurs about the head and neck in 60 per cent of the cases In aspergillosis the parasites have a special affinity for the pulmonary system and also frequently attack the canal of the ear the nasal sinuses and the conjunctiva The clinical picture of ear canal infections by *Aspergillus niger* and *Aspergillus fumigatus* and their treatment are described in detail The lung lesions in all fungus infections are difficult to distinguish from pulmonary tuberculosis It has been found that tubercle bacilli grown on special media begin to show branching filaments in the third generation The tubercle bacillus may be more closely related to the fungi than to the bacilli In all fungus infections large doses of potassium iodide appear to be almost a specific

K-Y Lubricating Jelly

'K-Y—is the best lubrifacient'

THE LANCET

K-Y Jelly is a surgical lubricant used almost universally for the lubrication of sounds, catheters, cystoscopes and for digital examinations

K-Y Jelly is bland, non-toxic, water soluble, non-greasy and antiseptic

It does not interfere with electric current, and is thus particularly useful for lubricating glass and metal electrodes

K-Y Jelly is also a soothing dressing for minor burns, for chafing and for pruritus It will also close the cracks in hands roughened by continual use of antiseptics

K-Y Jelly is packed in compressible tubes for quick, hygienic and economical application

K-Y Jelly

One of the products of Johnson & Johnson (GT BRITAIN) LIMITED

CITY OF LONDON MATERNITY HOSPITAL

CITY ROAD E.C.1

Incorporated by Royal Charter

The Hospital offers valuable facilities to Qualified Practitioners and Medical Students by means of its **Four weeks'** and **Two weeks' Residential Courses**, for observing Obstetrical Complications and conducting Labours. Nearly 2,000 patients annually.

RALPH B CANNINGS, Secretary

QUEEN CHARLOTTE'S MATERNITY HOSPITAL

MARYLEBONE ROAD, N.W.1

Medical Students and Qualified Practitioners admitted to the Practice of this Hospital. Unrivalled opportunities are afforded of seeing Obstetrical Complications and Operative Midwifery (about one half of the total admissions being primiparous cases). Over 2,700 patients are admitted to the Wards annually, and in the Ante-natal Department there are over 20,000 attendances per annum. Clinical demonstrations are given by the Staff daily.

For full particulars apply H. B. STOKES, Secretary-Superintendent.

THE NATURE AND TREATMENT OF

ASTHMA, HAY-FEVER & MIGRAINE

With Clinical Studies on Pyrogenic Therapy, Oxygen Want, Examination of Chest, Bronchitis, Pneumonia, Phthisis, Phenol-sulphonephthalein, Renal Disease, etc

Thirty two chapters (except one) republished from the "British Medical Journal and "The Lancet"

By A G AULD, M D

One closer study one finds evidence that they have been revised up to date so that they represent the author latest views Grateful for the mature views of this originator of the peptone on his treatment or on allergy in general as well as for the many wise hints or tips born of his manifold and long experience The book is a striking testimony to the powerful observation painstaking recording and scientific deduction of our older physicians who yet moved with the times and could handle the most modern weapons The book is one which the thoughtful and even critical practitioner would find well worth purchasing —SOUTH AFRICAN MEDICAL JOURNAL

There are few practitioners born since the date of the earliest articles who will not gain much useful information and many useful hints from them Dr Auld ranges over a variety of subjects from the use of calomel in dropsy to method of examining the lung and kidney Various pulmonary conditions are acutely discussed but the bulk of the book deals with the remedy for asthma—peptone—which he introduced and with which his name is associated both in this country and abroad Latterly he has devoted attention to perfecting technique in its use and to defining the class of case to which it is best suited Dr Auld is to be congratulated on this record of his achievement —GLASGOW MEDICAL JOURNAL

AN IMPORTANT DEVELOPMENT *in the Practice of Heat Therapy*

AND AN INVITATION TO THE DOCTOR

The curative and slimming properties of "sweating" baths have been accepted since the days of the Romans The counter-balancing drawbacks of the methods employed have however, restricted their use and efficiency Not until the introduction of Zotofoam could it be claimed that a system has been evolved which made the heat bath really safe, simple and pleasant

Zotofoam by utilizing the remarkable insulating properties of air collected scientifically in the form of foam can induce rapid intense perspiration and under certain conditions may be accompanied by a fall in pulse rate and blood pressure Treatment may, therefore, be enjoyed even by those to whom normal hot-water baths are *forbidden* Naturally, since the patient is surrounded only by a light mass of foam, no sense of pressure or oppression is experienced Additional benefit derives from the skin massaging action of millions of bursting micro-bubbles

Treatment is frequently given in conjunction with Pine, Brine Sulphur, Iodine, Oxygen or CO_2 where indicated

To enable the doctor to obtain really first-hand experience of Zotofoam Therapy the proprietors are always delighted to provide demonstration treatments for members of the medical profession

To SOAPLESS FOAM LIMITED,
17 18 Dover St (T 6), London, W 1

I wish to accept your offer of Zotofoam Treatment Convenient times at which this treatment could be taken are

You Can Confidently Recommend this Miniature DEAF AID

A HIGH FIDELITY VALVE AMPLIFIER IN REMARKABLY COMPACT FORM

As a medical man you know that in all cases of deafness only a valve amplifier can give genuine long distance hearing plus really high fidelity reproduction You know too the danger of faulty amplification and the frequency with which it leads to an increase in deafness Here is an instrument with the wide frequency range of 50 to 6 000 cycles per second It enables even the very deaf to hear at a distance and to join in general conversation Yet thanks to careful planning and the use of special midget valves it is so compact that it can be covered by a man's hand Let me send you the Amplivox brochure describing all Amplivox models and containing striking testimony from many eminent men

"CERABAN" ADHESIVE SELF-SUPPORTING BANDAGE

The Supplementary or Alternative Treatment to Self-Adhesive Elastic Bandages for

SPRAINS, DISLOCATIONS, CONTUSIONS, SWELLINGS, VARICOSE VEINS, VARICOSE ULCERS, etc.

Its use eliminates the risk of Dermatitis which so frequently arises from the application of Self-adhesive Bandages

"CERABAN" whilst free from rubber, possesses elastic properties and when carefully applied to the limb gives substantial support It is porous, adhesive, and non irritating, will not chafe and permits of complete respiration of the skin

In the treatment of Varicose Ulcers the use of "Ceraban" Bandage eliminates the risk of Dermatitis which occasionally occurs through the application of self-adhesive Elastic Bandages In the less severe of such cases a distinguished authority writing in the *Lancet page 580, Sept 7th, 1935, issue* recommends the use of "Ceraban" Bandage cut in strips as a first and protective dressing prior to covering with self adhesive Elastic Bandage and in the more serious cases the complete replacement by "Ceraban" It is waterproof, antiseptic, and being spread on an extensible material readily conforms to the shape of the limb and therefore will not slip

HALIBORANGE presents Allenburys tasteless and odourless Halibut-Liver Oil, associated with additional vitamin D and Allenburys Orange Juice

One teaspoonful of Haliborange is equivalent in vitamins A and D to one teaspoonful of cod-liver oil

Haliborange is an excellent addition to the diet of babies as a precaution against rickets and scurvy For older children, adolescents, or adults, it is a prophylactic vitamin tonic

Haliborange

In 5, 10 and 40 oz bottles

A step in the right direction

New Cocoa process means improved nutrition for the masses

THE desirability of increasing the nutritional value of the diet of the masses is too obvious to need emphasis here Because it achieves this end without adding one penny to the cost of meals, we believe the new predigestion process now used in making Rowntree's Cocoa will be of real interest to every medical man

This new predigestion process makes for improved nutrition in two ways —

1 The buffering power of Rowntree's Cocoa is increased by 10%—and consequently its role in the digestive process is increased accordingly It now makes even milk three times as digestible The increase in digestibility is particularly noticeable with the enzyme erepsin, making this improved cocoa particularly beneficial to children Practically no indigestible protein now passes into the large intestine, thus bacterial decomposition and the accumulation of poisonous substances in this region is avoided

2 The protein in Rowntree's Cocoa is now more digestible than that in other cocoas This means that it actually builds more bone and muscle than other cocoas—again a factor of particular value in the case of children

★ ★ ★

This improvement in Rowntree's Cocoa has been made without altering the delicious flavour in any way The price is also unchanged

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the protocarbonate of iron The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The 'Jelloids' are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated

Iron Jelloids

You are cordially invited to apply for samples for clinical test
The Iron 'Jelloid' Co Ltd, King George's Avenue, Watford, Herts

MIL-SAN

The Scientific Contraceptive

. . . its independence of variables

Since MIL-SAN is a viscous jelly, it is completely independent of all variable physiological conditions The importance of this is recognized by medical men who have had clinical experience of chemicals applied in any form where the time before the release of the chemical depends upon the factors of temperature, moisture or pressure Obviously this is peculiarly so with a contraceptive where the conditions may vary so widely

The uncertainty of these factors explains why MIL-SAN has been produced in a form which is independent of them There is nothing to melt, dissolve or foam, and all risk of these actions failing does not arise since MIL-SAN is applied with all its ingredients ready to act immediately

The MIL SAN method of application by means of ready filled, single application tubes is simple, ensures the quantity, maintains hygienic conditions and is proof against carelessness

MIL SAN is stable in all climatic conditions, is non injurious and non toxic Its low pH ensures the immediate immobilization and death of spermatozoa despite the buffering action of the seminal fluid, while its low surface tension causes it to penetrate rapidly into the rugae of the vaginal and cervical flora.

Full information and specimen tubes are sent on request to all interested members of the medical profession

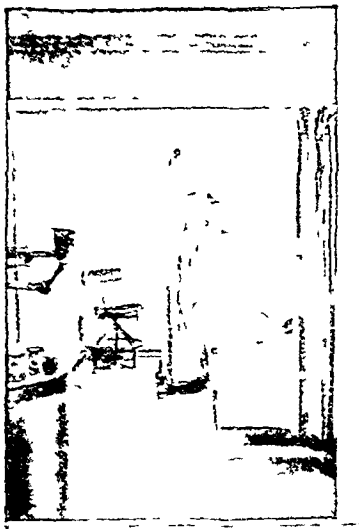
LIVOGEN

Design from Greek Vase
A Warrior with Bow looking along an Arrow

Large Bowel Infections



THE use of ordinary purgative agents in chronic colitis and other inflammatory conditions of the large bowel is to be avoided on account of their tendency to increase existing spasm of the musculature and to aggravate inflammation of the mucosa

Cristolax is the ideal agent with which to 'clear' the bowel in such conditions Its routine use diminishes mechanical friction while exerting a beneficial soothing effect The formation of local areas of stasis behind bands and constrictions is successfully avoided

Cristolax combines 50 per cent of the purest medicinal paraffin of correct viscosity with Wander's Dry Malt Extract This palatable effective yet harmless intestinal lubricant is free from oily or disagreeable taste and its crystalline form ensures easy administration

COLLIRON

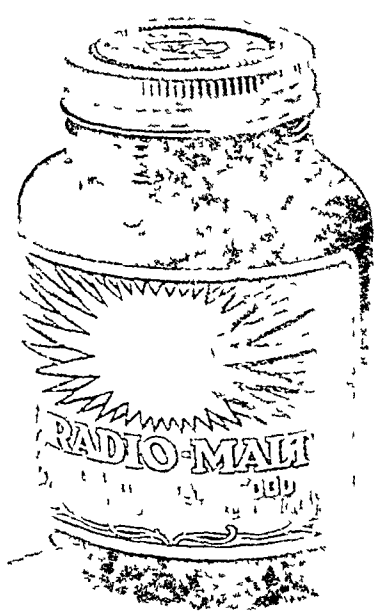
(Evans)

Colloidal Ferric Hydroxide with traces of Copper

Colliron is particularly suitable for the anæmias associated with Pregnancy. It is readily assimilated and gives, therefore, a prompt tonic action in

DEBILITY and FATIGUE

Colliron is non-constipating and is the ideal form of iron for children Being highly concentrated a small dosage suffices for average conditions



Five minims of Colliron contains the same amount of iron as a Blaud's Pill

In 4 fld oz bottles 3/- each In 16 fld oz bottles 9 6 each

The "QUEEN CHARLOTTE'S" Portable GAS AND AIR MACHINE

The British Oxygen Company has collaborated in producing a portable apparatus for gas and air administration intended mainly for use by midwives its outstanding features are complete safety low cost portability compactness, simplicity

For midwives general practitioners or dentists Model B (illustrated) is most suitable In size and shape it is like an attache case convenient for carrying or strapping to a bicycle carrier and its price without cylinder is £12 12 0 The working is simplicity itself and its general appearance inspires confidence in the user An intelligent patient can safely administer the gas to herself for the quantity of gas inhaled is self-controlled by the patient's breathing Model A is lighter and smaller Model C is larger and has room for two cylinders Prices respectively, £11 11 0 and £13 2 6

Model B (as illustrated) without cylinder, £12 12 0

Spare parts and service from any B O C Branch Nitrous Oxide supplies delivered by motor in important towns

INFRA-RED RADIATION
IN GENERAL PRACTICE
The "Duplex" Apparatus

The present wide spread interest and use by the medical profession of this method of treatment is undoubtedly due to the remarkable results attending its application primarily in RHEUMATIC AND ALLIED DISORDERS FIBROSITIS SCIATICA, LUMBAGO NEURITIS SPRAINS BOILS AND CARBUNCLES PYLOROSPASM ETC INSOFAR AS RHEUMATIC AND ALLIED DISORDERS ARE CONCERNED THE EXTRAORDINARY RELIEF OF PAIN BY HEAT RAYS IS ABUNDANTLY CONFIRMED IN THE COMPREHENSIVE SURVEY INDICATED IN THE REPORT OF THE B M A COMMITTEE ON THE CAUSATION AND TREATMENT OF ARTHRITIS AND ALLIED CONDITIONS (see *B M J* June 17th 1933)

There is nothing new in the application of infra red radiation It is but the logical sequence of the epoch making discovery of Prof Finsen in 1883 The apparatus here described is the product of research for a simple yet highly efficient apparatus for the convenient application of this form of radiation devoid of unnecessary elaboration perfectly safe in use and at a very moderate cost It is supplied in two models one with fixed base and the other with collapsible base for visiting cases A long wave infra red non luminous generator with an interchangeable luminous heat bulb is provided Price complete for either model is 95/6

IMMEDIATE DELIVERY CAN BE GIVEN

The Original and Standard Emulsion of Petroleum

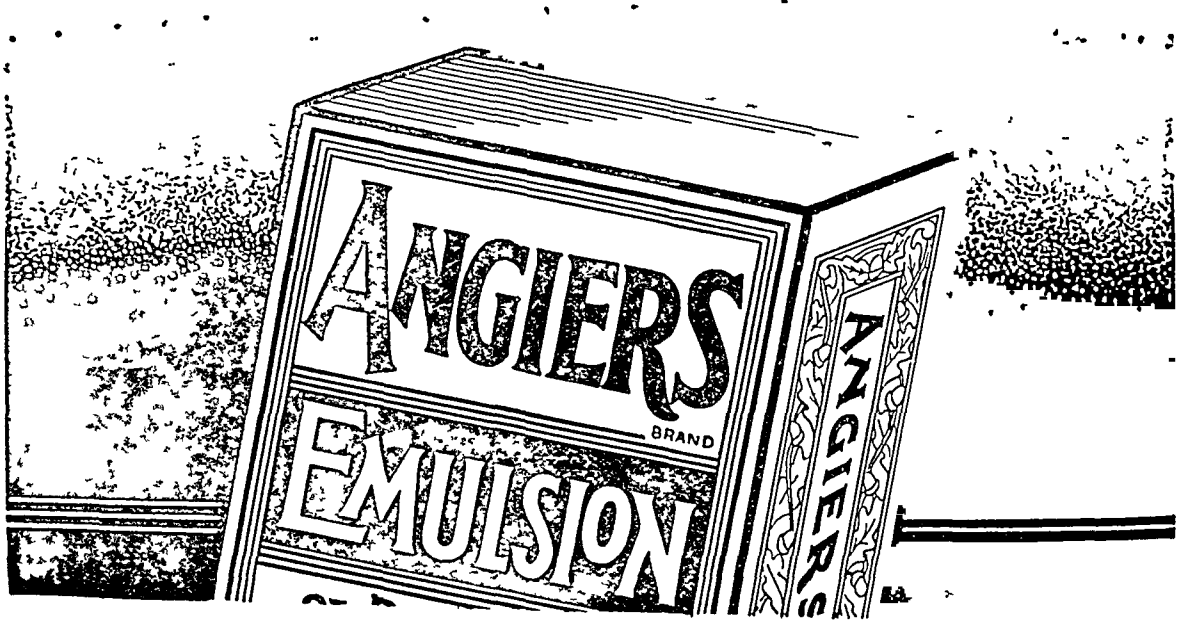
Angiers Brand Emulsion

is made with petroleum specially purified for internal use It is the original petroleum emulsion—the result of many years of careful research and experiment

Influenza and Sequelæ

The unique soothing properties of 'Angiers' and its favourable influence upon assimilation and nutrition make it eminently useful both during and after influenza It has proved most efficacious in relieving the catarrhal symptoms, whether tonsillar, bronchial or intestinal, also in combating the nervous depression and debility After the attack, or when the patient's nutrition and vitality are at the lowest ebb, try the continued use of 'Angiers' for convincing proof of its effects as a tonic and restorative

Bronchitis, Sub-Acute and Chronic



There is a vast amount of evidence of the most positive character proving the efficacy of 'Angiers' in sub acute and chronic bronchitis It not only relieves the cough, facilitates expectoration, and allays inflammation, but it likewise improves nutrition and effectually overcomes the constitutional debility so frequently associated with these cases

In Gastro-Intestinal Disorders

of a catarrhal, fermentative, ulcerative or tubercular nature, 'Angiers' is particularly useful It exercises sedative, demulcent, lubricant effects throughout the entire intestinal canal, and it restores tone to all the digestive functions Moreover, it offers the very best vehicle for the administration of astringents and antiseptics (bismuth, salol, &c) The emulsion may be administered undiluted or in any desired vehicle

The Therapy of Choice

Certain blood dyscrasias (aleukemic leukaemia, aplastic anaemia, etc) present signs or symptoms similar to agranulocytic angina Accurate differential diagnosis is essential before treatment, since there is NO EVIDENCE to show that 'Pentnucleotide' is indicated in such conditions

There is, however, WELL-SUPPORTED EVIDENCE to show that in cases of true agranulocytic angina, 'Pentnucleotide' has proved of value in a high percentage of cases

This is demonstrated by recent summaries of authoritative opinion both in this country and abroad

"It appears, clinically that results are better with 'Pentnucleotide' than with any other form of therapy every case should be given the benefit of a trial with such therapy"

SOPPMAN— Leukopenic States — *Amer Jour Med Sci* January, 1936

"The results with pentose nucleotide however, have seemed to be so much better than with the best of the older methods that it is at present the method of choice"

ADAMS— A Review of Certain Aspects of a Recently Recognised Disease of the Blood (Agranulocytosis or Agranulocytic Angina) — *Ministry of Health Report No* 76, London 1935

"When it (agranulocytic angina) is recognized in its early stages and 'Pentnucleotide' therapy and blood transfusions are given, and these are the most promising forms of treatment, the mortality has been reduced to about 25 per cent"

STURGIS— Review of Some of the More Recent Advances in the Study of Blood Diseases —*Science* April 19 1935

MANDELIX

(*Elixir of Ammonium Mandelate B D H*)

The following extracts from published reports provide evidence of the value of Mandelix (Elixir of Ammonium Mandelate B D H) in the treatment of urinary infections

'... a sterile urine was effected in a week or less though all had a chronic infection (*Lancet* April 4 1936 p 769)

'... the most satisfactory and pleasant method of giving mandelic acid' (*Lancet*, November 7 1936 p 1083)

'... the urine should become sterile within seven to ten days unless there is some anatomical abnormality ... on the whole, results are excellent' (*Brit Med Journ* September 19 1936 p 599)

'B coli pyelitis ... much better results ... now being used in preference to other preparations ... in each case the pH was reduced satisfactorily and the urine rendered sterile within a very short time' (*Lancet*, November 7, 1936, p 1087)

Hypertension and subacidosis . . . .

Most of the minor ailments of mankind have no name, and therefore, receive but small attention Yet it is probably among the common malaises of which, knowing little, we are inclined to make light, that the sources of some of our most lethal diseases are to be found The realm of minor illness is indeed an unpathed and almost unexplored territory, offering great opportunity to the medical adventurer

There are two recognisable and measurable signs that characterise a good deal of this unnamed illness These are, some degree of hypoalkalinity or subacidosis, and some rise of blood pressure There seems little doubt that behind these conditions, and causatively related to them, is a deficient or sluggish elimination of the waste products resulting from protein utilisation The resulting auto-intoxication is, of course, likely to be increased by the introduction of such added poisons as alcohol, tobacco, and so on, but the main trouble would seem usually to consist of incomplete combustion and eliminatory inadequacy Many doctors have found that in these cases of subacidosis, a halfway definite improvement in the general symptoms, and a diminution of the H-ion concentration, often result from the taking of a small quantity of ENO's " Fruit Salt " in half a pint of water once or twice daily ENO s " Fruit Salt " is an effervescent granular preparation, consisting of alkalis in combination with fruit acids It is entirely free from irritating mineral purgatives, and has no added sugar or flavouring matter The granules dissolve instantly in water, forming an agreeable and refreshing drink It acts as a mild and painless laxative, this action being due to the retention of water within the alimentary canal through osmotic law with resultant slight increase of tension and of peristaltic impulse

In ENO's " Fruit Salt " it is claimed we have at our disposal a carefully compounded pure and standardised preparation, entirely free from the harsh and disagreeable sulphate of Soda and Magnesia ENO's "Fruit Salt " has been used and prescribed by thousands of doctors for over 60 years, during which time its reputation has become world wide

ENO'S 'FRUIT SALT'

The words Eno and " Fruit Salt " are registered trademarks

The depletion of bodily reserves associated with Epidemics

INFLUENZA, Measles and Whooping-cough, are specially dangerous on account of the high attendant risk of pulmonary sequelæ, such as pneumonic and tuberculous invasions

Such complications can be largely prevented by maintaining the weight and the vitality of the patient with readily assimilable nutriment, both during illness and in convalescence

The value of Virol during an epidemic period (Feb 21—May 15, 1935) is conclusively demonstrated by the following abstract of a recent investigation* into the supplementary feeding of children —

Supplement to normal diet	Total gain in twelve weeks (ozs.)	Average gain per child per week (ozs.)
None	79	0 55
Cod Liver Oil	234	1 6
Halibut Liver Oil with milk	279	1 9
VIROL	526	3 6

The ease with which the constituents of Virol are assimilated, and the physiological balance existing between them afford a ready explanation of these important results

VIROL

*Full Report as published in "The Medical Officer," will be sent on application to Virol Ltd., Ealing, London, W 5

VIROL—In Jars, 1/6 & 3/6, ½ gall 15/-

Simple syncope occurs under a variety of circumstances The erect posture, long hours without food, convalescence after debilitating illnesses, hot stuffy rooms, or exposure to cold and damp all play a part, but there is evidence to suggest that the emotional tone of the victim at the moment plays an important part in the precipitation of the attack A hundred onlookers may see a child run down in the street but perhaps only one will faint Received by one or other of the special senses the stimulus itself does not necessarily cause fainting, but the emotional idea—often disgust or loathing—dominant in the mind of the subject at the moment may be the main determining factor in the initiation of these circulatory reflexes, which produces a sudden change in the mechanics of cerebral blood flow A slow heart beat in itself is not harmful, as witness the rate of 28 or 34 maintained for years in cases of heart block Similarly a low blood pressure of perhaps 90 or 100 mm Hg may be entirely symptomless, but an abrupt alteration from a high to a low level in pulse rate or blood pressure seldom passes without the production of symptoms

The slow pulse and particularly the abrupt loss of vasomotor tone which form the essential features of simple syncope are in effect a transient disturbance of the reflex control of the circulation exerted by the autonomic nervous system This suggests that just as receptor organs situated at the bifurcation of the carotids are capable of receiving and transmitting afferent stimuli to the medulla with resulting cardiac depression and lowered vasomotor tone, so also through similar but unrecognized channels the medulla may be influenced from higher cerebral and other centres with a resulting disorganization of these usual circulatory reflexes constantly passing through this busy regulatory area

Carotid Sinus Syncope

More conclusive evidence of the influence of the autonomic nervous system is afforded by the recent studies of Weiss (1933) and Ferris *et al* (1935), who have revealed in a group of people liable to fainting attacks a peculiar sensitivity of the carotid sinus to mechanical pressure in the neck That it was possible, by pressing with the fingers on one or other sinus, to reproduce constantly in a matter of seconds an exactly similar train of symptoms as those for which the patient sought advice yields very good evidence of a hypersensitive state of the sinus mechanism

Fainting, it was discovered, resulted from one or more of three distinct mechanisms (*a*) a marked cardiac asystole or sudden slowing of the pulse with or without a marked fall in the arterial blood pressure, (*b*) a striking fall in the blood pressure without essential cardiac slowing, (*c*) a cerebral type associated with a striking degree of facial pallor but without alteration in the heart rate or blood pressure level The origin of the fainting and convulsions in the first two groups associated with [illegible] and hypotension is clearly attributable to a [illegible] ischæmia and is directly comparable to [illegible] recorded in simple syncope The experimental data indicate such a close parallelism between these two forms of sinus syncope and the simple vasovagal attack that they are almost certainly of a similar nature Paralysis of the parasympathetic nerve endings with atropine accelerated the cardiac, but not the peripheral vascular changes Both forms were prevented by the previous administration of adrenaline

Arteriosclerosis or hypertension was a common clinical finding but a local mechanical cause for the increased sensitivity was demonstrable in nine of the fifteen cases studied, a small tumour pressing on the sinus in three instances Furthermore, operative removal of the tumour and section of the sinus nerve supply abolished both the spontaneous and the induced attacks It is well known that tumours in this situation are often associated with syncope (Cassidy and Page, 1928), and from the studies of the Boston workers the mechanism seems clear

Cerebral Syncope of Sinus Origin

The cerebral type of carotid sinus syncope, in which fainting occurs without alteration in heart rate or blood pressure, has also been carefully investigated (Ferris *et al*, 1935) Earlier observations suggested that these seizures resulted from reflex vasoconstriction of the cerebral vessels, but further experiments designed to influence cerebral blood flow cast a doubt on the earlier explanation In spite of the previous administration of adrenaline or histamine, pressing on the sinus is readily induced attacks, and measurements of jugular blood flow failed to yield evidence of a generalized cerebral anaemia during the seizure Weiss and his co-workers tentatively suggest for the regulation of the conscious state the presence of a special area or centres in the brain closely related to the autonomic system Whether in the cerebral form of syncope the afferent reflex from the sinus travels over the same pathways as those responsible for the cardiac depression and hypotensive forms is difficult to decide —probably not At all events, cerebral syncope was not prevented by atropine, and this suggests more purely sympathetic channels

In a proportion of cases considerable benefit was obtained by stripping the coats of the carotid artery on the more sensitive side It is yet too early to judge of the permanence of the results, but a recurrence of spontaneous attacks was observed in three of ten cases operated on Fortunately hypersensitivity of the sinus mechanism is not necessarily permanent, and much good was done several patients by measures directed to the improvement of their general health Patients presenting this form of syncope apparently fall into a distinct clinical group Weiss points out that in virtue of their unstable heart rate, easy fluctuations in blood pressure, and low metabolic rate they might be vaguely classified as examples of vasomotor neurosis or instability Carotid sinus syncope is a definite entity, and when the problem of repeated syncopal attacks is encountered in practice firm pressure applied first on one side and then on the other for ten or twenty seconds will form a useful clinical test for sinus hypersensitivity Further, careful palpation of the neck may reveal a local mechanical cause for the recurring seizures

Postural Hypotension

This peculiar variety of fainting occurs but rarely and has certain characteristic features which clearly indicate a disorder, more or less permanent, of the autonomic system It is, however, uninfluenced by carotid sinus stimulation Originally described and carefully investigated by Bradbury and Eggleston (1925) little has been added to our knowledge by subsequent observers Its leading symptom is readily induced fainting on assuming the upright position There is a marked and abrupt drop in the systolic and diastolic pressures when the patient stands erect, and this is associated with actual syncope or marked weakness and giddiness The symptoms are accentuated in hot weather Two other observations serve to give a clue as to the nature of the disorder These are a local or generalized deficiency of sweating and the failure of the heart to increase markedly in rate when the patient stands erect Adrenaline, while it augments

BAYER

BAYER PRODUCTS LTD, AFRICA HOUSE, KINGSWAY, LONDON, W.C.1

Case I

A lady, aged 57, seen in June, 1934, had been having "giddy turns" once a week, once a month, or at less frequent intervals for four years They occurred when out walking, when sitting quietly in a chair, and rarely when lying in bed She described the attack as a sudden feeling of "something coming over her," then fell to the ground and remained unconscious for ten minutes or more Slight twitching movements of the limbs had occasionally been observed by onlookers Her son a doctor, noticed on one occasion that her pulse rate was 30 before she had fully regained consciousness When on holiday in July, 1933, she had an attack, felt faint fell and lay in the street unconscious for nearly half an hour A consultant who saw her some days afterwards found her pulse rate 70, regular, and electrocardiograms showed normal rhythm Her blood pressure was then 150 systolic and 70 diastolic, the radial pulses were equal, and the vessel walls healthy Owing to her obesity it was not possible to determine accurately the size of the heart, but the electrocardiogram demonstrated a marked left-sided preponderance with normal conduction time A soft systolic murmur was heard in all areas As no evidence of heart-block was found at the time of examination a diagnosis of simple syncope was made

On June 4, 1934, I saw her for the first time, and at her home shortly after an attack recorded an electrocardiogram which showed conclusively the presence of complete heart-block On June 8, suspecting from the frequency of the seizures that the block would be transient, a further electrocardiogram was recorded This revealed a normal rhythm, the picture being exactly similar to that recorded the previous year (July, 1933) some days after an attack These facts were sufficient to indicate the mechanism of the production of the syncopal attacks, and justified a diagnosis of intermittent complete block with Stokes Adams seizures Adrenaline and ephedrine reduced the frequency of the attacks for a time, but she died a year or so later during an attack

A further case indicates the benefit which may result from appropriate treatment

Case II

A schoolmaster led a very active life until at the age of 61, in 1925, he had a sudden attack of unconsciousness while in church Immediately after the seizure the pulse rate was recorded at 35 a minute Attacks recurred at intervals of a few weeks, but with the passage of time they increased in frequency until by 1934 he was experiencing as many as six Stokes Adams attacks a week Life was made a misery for him He had no other cardiac symptoms Seizures occurred at any time in bed at night, moving about in the house or when working in the garden In some he fell unconscious, in others he was momentarily giddy for a few seconds He knew of no provoking cause Attacks were sometimes absent for a few days at a time On other occasions he had as many as four or five in twenty four hours Seen in May 1934 the pulse was regular at 80 a minute, the heart of normal size with no evidence of valvular disease and the blood pressure 124 mm Hg systolic and 68 diastolic There was a marked degree of generalized arteriosclerosis He was thin and under weight, and had suffered from a mild glycosuria controlled by diet without insulin since 1931 The urine was negative An x ray of the heart revealed no abnormality, and his electrocardiogram in the interval between attacks was of normal form without any evidence of heart-block He was advised to take 1/2 grain ephedrine thrice daily Under this treatment the attacks ceased and there was a great improvement in physical well being and mental alacrity In March, 1936, he had two minor attacks In August 1936 he had two attacks these were attributed to the fact that he had forgotten to take his usual dose of ephedrine Otherwise, during the past two and a half years he has had no attacks and his improvement in health is remarkable

In this case the diagnosis was made on the frequency and character of the seizures, the recognition of the slow pulse immediately after the attack, and the regular normal rhythm at other times The absence of other circulatory symptoms, such as dyspnoea, precordial pain, or oedema, would appear to be a common feature of these examples of cardiac syncope with intermittent complete block My experience indicates that there are in all probability different clinical types of intermittent block, and doubtless the mechanism responsible for the abrupt and unexpected cessation of ventricular beating varies in different cases In some, local lesions in the auriculo-ventricular bundle may be responsible, in others reflex vagal influences, or the ventricles may be limited in their range of rate

Paroxysmal Tachycardia

A diminished cerebral blood flow may result from an excessive ventricular rate when the volume output per beat is greatly diminished In these cases mild syncopal attacks or epileptiform seizures occasionally occur, and are usually preceded by a sensation of violent and rapid palpitation (Barnes, 1926, Clarke, 1907) In my experience fainting from this cause is more common in the later age groups, when sclerosis of the cerebral arteries might be expected Younger people, the subjects of paroxysmal tachycardia, seldom complain of syncopal attacks In either group the seizures are more often seen if the paroxysmal heart action begins when the subject is in the erect posture It should be remembered that digitalis is a potent cause of paroxysmal tachycardia when used to excess in unyielding cases of congestive heart failure Strangely enough in this instance palpitation is seldom noticed by the patient, but the abnormal rhythm should be suspected when there are fits or faints during the treatment of congestive failure

There are other cardiac causes for faints After coronary thrombosis the acute fall in blood pressure may sometimes be responsible, or the damage done to the muscle may account for the development of a ventricular tachycardia with epileptiform seizures at the time of development of the abnormal rhythm I have seen several examples of this cause of fainting and some wonderful recoveries under quinidine therapy Syncope occasionally accompanies angina of effort Valvular lesions are however, rarely associated with syncope I agree with Levine (1936) that of the valvular defects aortic stenosis rather than regurgitation is the commonest form associated with syncope Clinical evidence leads to the conclusion that it is not so infrequent a lesion as pathological observations might indicate

Syncope in the mind of the layman is closely associated with cardiac disease Fortunately in young people organic vascular damage is as a rule easily excluded, but the pendulum has swung too far, and in my opinion it is justifiable to assert that fainting attacks in middle aged or elderly people are a not uncommon symptom of cardiac disease, sometimes the only one Even though physical signs are lacking, yet a careful clinical history and simple observations directed to the rate of the heart may give a valuable clue to diagnosis and suggest successful treatment

Cerebral Seizures

The features of the major epileptic attack are well known Petit mal is occasionally mistaken for a simple faint—but the more gradual onset, the longer period of unconsciousness, and the slower recovery favour simple syncope Hysterical fits are now so infrequent that difficulty in diagnosis seldom arises (Bramwell, 1936) Convulsions may be seen in such a variety of conditions—Walker (1936) has listed over sixty different states in which

AN INVESTIGATION OF INTERNAL RADON THERAPY

BY

F D HOWITT, C V O, M.D, M R C P.

Barnato Joel Laboratories Middlesex Hospital

In this country the use of radium has been largely confined to its local action in the treatment of malignant conditions in which the objective is a destructive or deterrent effect upon the growth In America and on the continent of Europe radium and other radio-active substances have been administered internally in small doses spread over long periods as therapeutic agents in a wide field of medicine, and considerable claims have been made as to their value Apparatus capable of producing radio-active solutions for oral administration, injections containing small quantities of radium salts, and radio-active pads for external application have, however, appeared on the market here, and there is some evidence that their use is on the increase Many of these are available not only to the medical profession but also to the public

It was thought worth while at this stage, therefore, to investigate certain aspects of the subject under complete hospital routine and the present paper is an account of the results obtained during the last five years Although, as will be seen the therapeutic results have been largely of a negative character this is thought to be no reason for omitting to publish the data

The objects of this investigation were (1) to determine what physiological or biochemical changes might be induced in patients by such comparatively small doses as these generally used, (2) to assess the value if any, of such treatment upon various diseases and (3) to ascertain the effects of stronger dosages than those hitherto employed and to find when they become dangerous Before recording the results of our experiments the following brief survey of what is sometimes known as mild radium therapy and of the literature available upon the subject is given

Mild Radium Therapy

The first disintegration product of radium is the radio active gas radon From the point of view of therapy it is important to distinguish clearly between the internal uses of radium salts and of radon

The salts of radium may be given by the mouth or may be injected intravenously or subcutaneously Both methods are attended by definite risk If given by the mouth considerable damage may be done to the mucous membrane of the intestines especially if the patient undergoing treatment is constipated and the salts are held up When injected intravenously it is stated (Oloff) that 80 per cent is retained in the tissues, principally in the bone marrow, and that it disappears from these situations only very gradually indeed Thus deposits of radium are formed from which radon may be produced for a long time

There is not enough evidence to determine the exact quantity of radio active salts which constitutes a lethal dose in man, but it is obvious that the internal administration of radium is attended with the gravest risks According to Gudzent, a single dose of salt containing the equivalent of 0 5 mg of radium element can prove fatal Among the women who have lost their lives working with luminous radium paint the total amount of radium found in the body at the time of death ranged from 0 01 to 0 18 mg The death of an American citizen was caused by the self-administered and repeated use of a solution containing one-thousandth of a milligramme each of radium and mesothorium per ounce of water

The introduction of radon into the body, however, presents a totally different problem from that of radio active salts Its activity does not last long, declining to one-half in 3 85 days and diminishing to less than 1 per cent in a month When radon is taken by the mouth about 90 per cent of the gas is eliminated through the lungs within an hour or two, and no more is exhaled after five hours It remains in the urine for a longer time, but very little stays in the body to form "active deposit" (Flinn)

There is, however, another important distinction between the uses of radon and radium salts Radon is a soluble gas so that when swallowed it can be absorbed from the alimentary canal, and may, through the circulation, reach every tissue in the body In this way it may be anticipated that there will be very free action by the alpha rays, which are known to have an intense local effect not necessarily the same as that produced when radium is applied in platinum or other containers which exclude the alpha rays entirely

The unit of radon is the millicurie which is the amount of the gas in equilibrium with one milligramme of radium element This unit has often been considered much too high for the measurement of very weak concentrations, and the Mache unit has accordingly been substituted, 2,500,000 Mache units are equivalent to 1 millicurie, or

1 Mache unit (M U) $= 4 \times 10^{-7}$ millicurie

Some spa waters are radio-active and one of the strongest of these is the spring at Joachimstal which has a content of 600 M U per litre Most radio-active springs contain weaker solutions than this, that of Baden-Baden, for instance, being 104 M U per litre It will be seen, therefore that the radio-activity of natural waters is exceedingly small though perhaps not negligibly so

Artificial radio active waters can be prepared in very high concentration, but most of the work published on the subject has been done with daily dosage of from 8,000 to 30 000 M U per day, usually contained in one litre of water although some (Bickel) have worked up to

The Lister Institute
OF PREVENTIVE MEDICINE

Therapeutic Substances Act, Licence No. 9

Concentrated

Anti-Meningococcus Serum (Group II)

(Globulin Solution)

The serum therapy of infections caused by group II organisms is often less successful than the specific treatment of group I infections due to types 1 and 3, which are usually associated with epidemics of cerebrospinal fever Accordingly, a group II serum has been specially prepared at the Serum Department of the Lister Institute This serum has been subjected to a process of concentration so that a large proportion of the inactive proteins has been removed, the dose of antibody is thus contained in a smaller volume of fluid

Three preparations are issued in concentrated form

(1) Anti-meningococcus serum (multivalent)

(2) Anti-meningococcus serum (Group I)

(3) Anti-meningococcus serum (Group II)

Anti-meningococcus Serum for Diagnostic Purposes

OUT-PATIENTS

These patients were given small doses of radon, equivalent to the larger doses referred to in the literature They came to the hospital daily, and drank measured quantities of radon water The treatment was begun with one-thirtieth of a millicurie (80,000 M U) in 15 oz of water Treatment was continued daily for four to six weeks in each case There were twenty cases in this series

Clinical notes were taken, including the weight and blood pressure of each patient and also of the general reaction to treatment Blood analyses were also made In the arthritic cases the degree of limitation of movement in the joints was also noted, and in some cases x-ray photographs were taken both before and after treatment

In assessing the value of any treatment on purely clinical observation it is important to bear in mind the following pitfalls

1 *The Psychological Factor*—Sufferers from chronic disabilities such as rheumatism are extremely susceptible to suggestion Every physician who is accustomed to dealing with chronic disease is aware of the eagerness with which patients are apt to embrace any new treatment, particularly is this the case when any enthusiasm is shown on the part of the prescriber Such enthusiasm may be of considerable therapeutic value, but it may obscure the true merits of the remedy In this instance the very word radium engendered hope For this reason the patients were not for the most part told the nature of the fluid they were drinking, other steps were also taken to ensure that any effect upon the patients produced essentially by the radon in the water could be substantiated

2 *Intercurrent Factors*—All chronic conditions normally run a variable course, with a tendency to remission The story told by a patient at any given moment, say at the end of a course of treatment, does not necessarily give a fair impression of the trend of events In the case of arthritis such factors as damp, alteration of temperature, and particularly mental strain and physical fatigue have a temporary but considerable adverse effect For this reason the symptoms were not only noted during and at the termination of the treatment, but they were also seen at intervals during two years after its cessation

3 The difficulty of withholding other forms of treatment during the investigation particularly in cases where local pain is evident It is frequently impossible to satisfy a patient solely with a general measure, and in cases of increasing pain or stiffness it would be wrong to do so Such accessory treatments obscure the value of the remedy under investigation

Taking all these facts into consideration we were unable to find any change in the clinical condition of these patients as the result of ingestion of radon in doses ranging from 80,000 to 240 000 Mache units

IN-PATIENTS

These were subjected to strict hospital routine, and in them it was possible to make a more detailed investigation including various pathological tests They were given much higher dosages ranging from 1 millicurie (2 500 000 M U) to 4 millicuries (10 000 000 M U) per day in 10 oz of water Various conditions were treated, including chronic rheumatism and hyperpiesia As controls three cases were given the same diet and general conditions as the treated cases and the same investigations were undertaken, using tap water instead of radon water

In the rheumatic group male patients representing various types of the disease were selected, and these were all admitted to the same ward, so that conditions of diet, fluid intake, and exercise could be controlled to the same standard Notes were taken of the clinical condition, and general investigations, including radiographs of the joints, were made before treatment began Initial blood counts and analyses and urine analyses were also made, and these were repeated at weekly intervals during the radon treatment The following pathological investigations were undertaken

The blood The erythrocyte count and haemoglobin index, differential white counts, and, in addition the blood uric acid, urea, and calcium values were estimated *The urine* A routine examination was made, and the uric acid, urea, and creatinine contents were determined The following results were obtained

Results

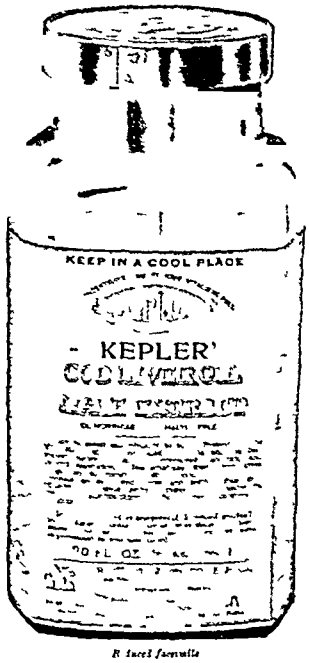
In the majority of cases the blood counts of both red and white cells were uninfluenced In certain instances, however, the erythrocyte count showed a marked tendency to fall, particularly when a dosage of 2 to 3 millicuries was reached and maintained, in two of these the fall amounted to one million red cells per cubic millimetre

The differential white cell count was not appreciably altered except in the cases of gout, where there was an eosinophilia The results of the blood and urine analyses were all within normal limits, with the exception of the gouty cases (vide Table)

GOUT (THREE CASES)

In three patients the administration of radon in large doses caused a definitely increased output of uric acid in the urine, but it was impossible to correlate this with the blood uric acid levels Two of the cases (Nos 3 and 5) showed a slight increase in blood uric acid during the early stages of treatment which later returned to the original value, but Case No 5 developed a subacute attack of gout just as the treatment began, thus obscuring the value of the results The third case (No 6) showed a slight fall in blood uric acid level, later returning to the original value

CONTROL AND RHEUMATIC CASES



In certain of the control and rheumatic cases with the same fluid intake there was a slight increase in the uric acid output, but not, however commensurable with that seen in the gouty cases In the controls and rheumatic cases the blood uric acid fell within normal limits

All the other biochemical investigations, including the estimations of blood urea, calcium, and phosphorus, gave results within normal limits

Clinical Findings

No improvement was noted in any of the cases of chronic arthritis, whether of the atrophic or degenerative type No increase in the movement of the joints was obtained, and no relief of pain in the muscles The general condition remained unaltered In certain cases of chronic gout, however, there did appear to be an improvement in the general symptoms, and in one instance at the end of treatment there was a marked reduction in the size of the tophi

A few cases of hyperpiesia were treated In these an initial fall in the blood pressure was sometimes obtained particularly when large doses were employed but this fall

and hands were rarefied, but there was no ankylosis Radon was given for two days at 2 millicuries, and for sixteen days at 4 millicuries The clinical condition remained unchanged

Case 2—In a patient aged 55, with spondylitis the pain in the back had begun eighteen years previously, with progressive stiffness On admission the nutrition was poor, but there was no obvious infective focus The arthritis was of the degenerative type, with limitation of movement in the spine right hip and right shoulder There was coincident fibrositis and right brachial neuritis The blood and urine were normal Radon was given for six days at 2 millicuries and for twenty-eight days at 3 millicuries The clinical condition remained unchanged

Case 3—A patient aged 59, had fibrositis and early osteo-arthritis On admission the nutrition was fair and there was no evidence of infection There was generalized muscular pain which was increased on movement The heart and blood pressure were normal An x ray examination revealed some lipping of the thoracic and lumbar vertebrae The blood and urine were normal Radon was given for six days at 1 millicurie and for twenty-two days at 3 millicuries The clinical condition was unchanged but eighteen months later gouty tophi were found

Case 4—In a patient aged 19, with fibrositis there had been a history of two years increasing pain in upper thoracic region On admission the nutrition was good, but there was a tendency to dorsal kyphosis with inability to flex the neck An x ray examination revealed a possibly normal spine, but there was irregularity of the ninth tenth and eleventh dorsal vertebrae The other joints were normal There was no evidence of infection or of tuberculosis, and the nervous and cardiovascular systems were normal There had been no improvement under diathermy and other physical treatments Radon was given for thirty seven days at 1 millicurie without benefit The spine was manipulated later with some improvement

Case 5—A patient aged 49 with tophaceous gout, had had the first attack nineteen years previously in the right foot Acute attacks followed at intervals of three to six months On admission large gouty tophi were seen on the knees and ears One which had been removed from the ear seven weeks before admission had left a septic focus The x ray examination showed a general rarefaction of all the bones of the hands suggestive of coincident rheumatoid arthritis The blood uric acid figure was 4 9 mg per cent and the sedimentation rate was 30 mm in the first hour The value of the pathological tests was somewhat obscured by a subacute attack occurring just before treatment Radon was given for six days at 1 millicurie for six days at 2 millicuries, and for twelve days at 3 millicuries Some improvement was noted in the general condition, and there was definite reduction in the size of the tophi

Case 6—In a patient, aged 59, with gout pain began in the left hand and left foot, and there was a four-years history Other joints had since been affected On admission there was swelling of the right wrist and left ankle The x ray examination disclosed the typical punched out gouty areas and slight rarefaction of bone The blood urea figure was 60 mg per cent, and the blood uric acid 4 37 mg per cent There was no obvious infection, and the other systems were normal Radon was given for six days at 1 millicurie, for six days at 2 millicuries for six days at 3 millicuries, and for six days at 4 millicuries On discharge the pain and swelling in the affected joints had diminished, and there was some general improvement

Conclusions

In the series of cases (out-patients) in which radon was given in small doses, such as those obtainable from apparatus in present use, no demonstrable change was found in the clinical condition Subjective improvement, due to the psychological stimulus and to other factors operating during the experiment, was neither more marked nor more frequent than in the controls Patients seen two years after treatment did not ascribe any permanent amelioration of symptoms to the treatment On the other hand the blood counts were not affected, and no injurious results were encountered

In the series of cases (in-patients) in which radon was given in very much larger doses no improvement was noted in the clinical condition except in certain cases of chronic gout The chemical analyses of the blood were unaffected again with the exception of the uric acid readings in this latter group More work remains to be

LECTURE ON FAINTS AND FITS*

BY

A RAE GILCHRIST, M D , F R C P Ed

Assistant Physician Royal Infirmary Edinburgh

That a large and variegated assortment of clinical conditions may first become manifest by a passing loss of consciousness with or without convulsions is a well known fact. Diagnosis, particularly some time after a single attack, often presents considerable difficulty It is therefore useful to collect and correlate the results of recent investigations and advances in this particular field particularly in the hope that a simple classification may lead to a clearer understanding of the mechanisms involved, and thus facilitate accurate diagnosis and appropriate treatment In such a wide subject it is only possible to discuss certain aspects which illustrate the problem as a whole and provide a basis for the investigation of the individual clinical case

Just as there is no entirely satisfactory definition of a faint, though it is rightly attributable to peculiar circulatory maladjustments so also even greater difficulties beset the exact definition of a fit Convulsive movements in the form of facial twitchings or muscular jerkings of the limbs may be observed in the severer fainting attacks and in fits generalized or local clonic movements confined to a limb or muscle group may dominate the clinical picture Convulsive movements are common to both but it is equally justifiable to employ the term fit to designate those attacks in which muscular movements are absent and an unnatural motionlessness is the prominent feature (Wilson 1928) Similarly certain fits may occur without loss of consciousness and the convulsive movements be local or widespread For these reasons I do not attempt to define either the faint or the fit recognizing that the one merges at times almost insensibly into the other I propose to limit this discussion to attacks characterized by sudden and transient weakness loss of muscular control a greater or less degree of amnesia if not actual unconsciousness with or without convulsive movements

Clinical Groups

The recognition of cerebral ischaemia as a cause of the convulsive state led gradually to the differentiation of attacks of unconsciousness into two broad groups—the syncopal due to transient circulatory defects and the epileptiform primarily of cerebral origin (Russell 1909 , Sutherland 1927) Actually between these two somewhat artificial groups there exists a wide gulf—a gulf bridged by the autonomic nervous system Recent investigations indicate the importance of this link between the central nervous system and the viscera autonomic reflexes exercising directly and indirectly a dominant role in the control of the circulation and in the maintenance of consciousness It has long been known that pressure exerted on the carotid arteries in the neck is capable of slowing the heart and by the work of Hering (1927) Heymans (1929) and their associates it has been conclusively demonstrated that concentrated at the dilated bifurcation of the common carotid artery—the carotid sinus—a rich nervous anastomosis exists in which lie various sensory receptors reflexly regulating heart rate and blood pressure This outpost of the autonomic system transmits afferent reflexes to the medulla via the glossopharyngeal nerve the main efferent channel being over the vagus nerve to the periphery Recent studies indicate that a hypersensitive state of the carotid sinus reflexes is responsible for certain forms of syncope (Weiss and Baker 1933), and though the mechanism varies in different instances yet it is sufficient to indicate the importance of the autonomic system in the regulation of the conscious state Recognizing that cerebral and general circulatory mechanisms are closely interwoven it seems justifiable and even if not very exact at least helpful from the point of view of practical medicine to submit a classification consisting of three broad groups according to the dominant mechanism

1 Seizures resulting from a disturbance of the autonomic nervous system

2 Syncope the result of an intrinsic disturbance of the heart beat

3 Seizures more directly of cerebral origin, due to local structural or general metabolic defects

Autonomic Nervous System

A study of the common syncopal attack is sufficient to indicate a disturbance of the usual balance between heart rate and blood pressure Beginning with a sense of uneasiness muscular weakness and restlessness the symptoms gradually advance until the victim becomes aware of a vague abdominal discomfort associated with nausea which increases the feeling of insecurity Lightheadedness blurring of vision and loss of power in the limbs accompanied by a feeling of coldness and sweating are usually recognized before the final collapse Lewis (1932 1918-20) has shown that these symptoms are associated with a progressive fall in blood pressure, often a decrease in the heart rate and has suggested the term vaso vagal attack to describe the underlying mechanism cardiac inhibition sudden hypotension and diminished cerebral blood flow being the predominant features (Starr and Collins 1931) Unconsciousness may last a few minutes during which time examination reveals a striking pallor particularly of the face low blood pressure a weak or almost imperceptible pulse usually regular but slow in rate—50 40 or 30 beats a minute or less being commonly recorded Recovery is gradual slower than the onset, and in the succeeding hours leaves the victim listless and unsettled

* A British Medical Association Lecture given to the Leeds Division on October 23 1936

states which merge from a bereavement, and they take their usual forms of tachycardia, taches, facial pallor, sweatings, giddiness, tremors, etc

Diagnosis and Rheumatism

When we were students at the medical schools the emphasis of clinical teaching was on diagnosis—the identification of the disease The chief question to be answered was ' *What disease has the patient got?* " At that time we did not notice the anomalies of the answers One patient would be said to have " got " an abnormality in his structure—for example, a gastric ulcer , another an abnormality in his chemistry, such as hyperchlorhydria , another an abnormality in his rhythm, perhaps tachycardia another an abnormality in his sensation—for example, a headache , another an abnormality, which was presumed but never demonstrated, such as nerve weakness, toxaemia, or being ' run down ' One of the diseases which a patient might get was rheumatism Sometimes this term referred to demonstrable structural changes, as in the case of fibrositic thickenings, or the abnormalities of rheumatic fever , but the word was often applied to any patient who complained of pain and stiffness in the musculature in the absence of demonstrable structural or chemical changes The word rheumatism " is a label—convenient, comprehensive, scientifically vague

We were taught also to ask another question—namely, What has the patient met?" I do not know if the question was ever put in these actual words As a rule it was framed by asking " What are the aetiological factors? Inquiries into aetiology were confined to the physical factors which the patient had encountered, such as trauma heat cold and wet dietary poisons, and microorganic invasion No investigation was made into psychological factors This was unfortunate, because to limit aetiological inquiry to physical factors is to misunderstand the meaning of illness The limitation has been and still is the occasion of many unnecessary failures in orthodox *medicine* For example, when inquiries are made into psychological factors the disease labels already mentioned frequently make sense "—that is to say, they become understandable as manifestations of emotional reaction

To know what a patient has *met* is often of more practical value than to know what a patient has *got* Aetiology, which regards the individual as a whole, may be of more importance than diagnosis, which, disregarding the individual concentrates on fragments of his anatomy, pathology, physics, chemistry, sensation, and so on The questions of aetiology are concerned with the integrated individual, and include

1 What kind of person is this? That is to say, with what constitution diathesis or pattern did he enter the world and how has that been modified by his environment both physical and psychological?

2 Why of all the days and weeks of his life did he begin to take ill when he did? This is an inquiry into the environmental factors he encountered about that time which were of a potency and nature likely to cause him to react by illness

3 Why did he take ill in the manner he did? For instance why after a bereavement does one person remain well another develop asthma another disordered action of the heart another gastritis another hyperthyroidism and another rheumatism?

It must be admitted that full answers to these questions are not possible in our present state of knowledge However by framing our inquiries along these lines much light can be thrown on the illness of individuals and also of communities To illustrate the application of these questions in a simple way an example may be quoted of a patient who had got rheumatism '

The date of the examination was July 1935 A single man 22 years old who had been on the sick list since March 12 because of severe pains in the right chest labelled pleurodynia complained of weakness giddiness sweating and loss of appetite His doctor had considered that he might have tuberculosis, but the x-ray examination was negative in this respect His face was pale and worn, and his eyes had a frightened expression He had tremors of the outstretched fingers, and tachycardia There was no anaemia, the haemoglobin percentage being 100 The only structural abnormality was a scar below the right scapula which was the result of falling on a spike four years previously

Discussion of Diagnosis

The results of examination suggested that the diagnosis of pleurodynia—a change in structure—was possibly correct The result of general examination indicated that there was disturbance of the autonomic and endocrine systems of a kind that is often diagnosed as hyperthyroidism—a change in chemistry If we regard a patient not as an *individual but as a* " *case*" *which* contains fragments that can be labelled, we might say, using the jargon that here was a ' case of pleurodynia and hyperthyroidism, " and that " appropriate treatment " for these " conditions " comprised massage, sedatives and perhaps iodine Now it is curious but true that when we find ourselves using the words " case ' and " condition " it is a sign that we have ceased to think further about the problems presented by the patient Only by discarding these two terms from our vocabulary and using the terms " person " and " reaction,' can we hope to increase our understanding of illness

Discussion of Aetiology

1 *What kind of person was he?* Physically he was well built and well nourished Mentally he was intelligent, and was ambitious to get on in the world

2 *Why did he fall ill when he did—namely, in March?* After leaving school he had entered an ironmonger s shop and had remained there as a shop assistant He was not happy and felt that " there were no prospects " However he was continually on the lookout to " better himself,' and early in December 1934, he applied for a position of commission agent which he had seen advertised in the papers In January he was interviewed, and was told that he was accepted He immediately resigned his position in the shop Unfortunately, in his eagerness he had omitted to understand that he would require to provide a capital sum of money before entering on his new duties He failed to raise the necessary funds, and was informed that he could not become an " agent " without them He was unable to obtain other employment, became sleepless, went off his food, and suffered from palpitation and weakness His mother suggested that he might be " in for a decline ' At first he refused to see his doctor, but early in March he developed severe pains in the right chest, and was put on the sick list with a diagnosis of pleurodynia

3 *Why did he fall ill in the way he did?* He took ill with an anxiety state in January, and with pain in March The reason for the pain being attached to the right side of the chest was probably twofold First, he had been injured there, and this part of the body was structurally inferior Secondly, his mother had suggested that he might have tuberculosis, and this fear had directed his attention to the chest

4 *Had he any purpose in being ill?* His illness acted as an explanation of why he was not working and why he had failed to obtain work

Comment

Although this man had previously encountered trauma, and as a result his structure was inferior at a certain site, he continued working and was free from symptoms for years He developed symptoms and ceased working only when he met certain psychological factors which by frustrating his particular drive, provoked severe emotional reaction The pain which he then experienced became attached to the site which was structurally inferior

the heart rate does not restore peripheral vasomotor control, and fainting is still apt to appear after its administration The heart rate is uninfluenced by atropine As an explanation for these findings it is reasonable to postulate a decreased activity of the autonomic nervous system amounting to a virtual paralysis of the peripheral vasomotor constrictor fibres It was also observed that the amount of urine excreted varied with posture being considerably less in the erect posture a finding attributable to the decreased renal blood flow when the patient was erect The extraordinary dependence of the blood pressure upon the influence of gravity is illustrated by the findings of Chew, Allen, and Barker (1936) in one of their patients

	Recumbent	Sitting	Standing
Blood pressure	Systolic, 140 Diastolic 80	Systolic 80 Diastolic, 50	Systolic 40 Diastolic 35
Pulse rate	64	64	68

Drugs are of little value in influencing the course of the disease Ephedrine in 50 milligramme doses even as often as every two or three hours does not always prevent attacks (Chew *et al* 1936) It is difficult to determine the site of the lesion but realizing the capacity of the splanchnic area it is conceivable that destruction of the coeliac ganglion or involvement of the lumbar sympathetic roots might account in some measure for the symptoms

This brief review of recent work serves to illustrate the fact that identical symptoms can be produced in a variety of ways In each and all the activity of the autonomic nervous system is disturbed in varying degree By way of contrast it is perhaps a little surprising that syncope is so uncommon after the administration of amyl nitrite The explanation probably lies in the fact that in this instance hypotension is to some extent compensated by tachycardia The fact that slow heart action and fall in blood pressure coexist in simple syncope indicates a disturbance in the reflex control of the circulation a transient failure to stabilize pressure and heart rate A penalty of the erect posture these forms of syncope indicating a maladjustment of the autonomic system are seldom observed other than in the upright position The force of gravity constantly puts a burden upon the fine adjustment of the circulatory mechanism It is also worth noting, from a diagnostic viewpoint that the syncopal attacks just described are unassociated with a sense of rotation Giddiness is common enough as a premonitory symptom, but true vertigo is not a feature of the autonomic forms of syncope

Syncope of Cardiac Origin

Under this heading may be grouped those cases in which the major defect lies in a sudden change in the dynamics of cerebral blood flow consequent upon an intrinsic disorder of the heart beat. The outstanding example is the Stokes Adams seizure associated with certain forms of heart block Attacks may vary in severity from the mildest associated with only a transient giddiness or unsteadiness to the most critical in which during a long period of ventricular asystole lasting three or four minutes muscular twitchings with cessation of respiration and urinary incontinence may occur Under these circumstances consciousness may not be regained for several hours or days after the return of the heart beat To witness the Stokes Adams attack in all its dramatic sequence is an unforgettable event in clinical experience

The literature contains no entirely adequate definition of the term Stokes Adams syndrome Neither Adams (1827) nor Stokes (1846) defined a syndrome, nor did they offer an explanation for their clinical observations It was Huchard (1893) unaware of the earlier observations of Morgagni (1761) or Spens (1793), who made the original attempt to marshal the relevant facts and defined the triad of slow pulse with syncope and epileptiform attacks as the maladie d Adams ou de Stokes Adams It is best to confine the term Stokes Adams seizure to those forms of syncope associated with a defect transient or permanent, in the conducting mechanism of the heart beat

The recognition of this type of syncope is not difficult when attacks are witnessed or when in the intervals between them, a persisting bradycardia suggests the presence of complete heart block As a rough and ready clinical test the inhalation of amyl nitrite is of help in elucidating the nature of a bradycardia when graphic methods of recording the heart beat are unavailable (Gilchrist 1934b) As a general rule amyl nitrite does not appreciably alter the ventricular rate when the block is complete, though there are exceptions Atropine does not yield a reliable test for the presence of complete block (Gilchrist, 1933)

The great majority of sufferers from complete heart block are seldom disturbed by seizures though at the time of the total severance of the bundle of His when the ventricles are for the first time starved of the auricular leadership and momentarily hesitate in the development of their independent rhythm one or more seizures may be seen When seizures do occasionally recur they are as a rule readily controlled by ephedrine (Gilchrist, 1934a)

Ventricular Arrest with Intermittent Complete Block

On the other hand there is a group of cases in which fainting attacks due to a transient paralysis of ventricular activity are common These people do not suffer from a persisting chronic block but only from time to time does the bundle of His cease to function As a general rule perhaps for weeks or months the heart beats in normal rhythm with no impairment of auriculo ventricular conduction suddenly without warning a varying period of ventricular asystole occurs accompanied by a faint of corresponding severity This event is followed by independent ventricular beating—complete heart block—for a brief space of time minutes or hours and then almost as suddenly normal rhythm is resumed and the pulse rate rises from 25 or 30 to 70 or 80 or more a minute It is important to note that in this variety complete block is only evident for a short time after the Stokes-Adams attack and that even immediately before the seizure there is no evidence of partial block I believe that this form of heart-block which affects middle aged or elderly subjects is often mistaken for senile or arteriosclerotic epilepsy It is certainly more common than the number of recorded cases would indicate Carter and Dieuaide (1923) collected eight cases and since then only ten others have been reported During the last few years I have had under my personal observation eight cases of intermittent block with Stokes Adams seizures

The diagnosis is not difficult if the absent pulse is noted during the attack or the steady slow rate for a short time thereafter but the presence of normal rhythm in the intervals between seizures and the frequent absence of all other cardiac symptoms may lead to some confusion in making the diagnosis, as the following case indicates

with psychoneurosis who develop these complaints are usually labelled with the word "lumbago" Instances of such 'lumbago' are not uncommon in individuals whose *pride has been hurt,* as, for example, in persons who through unemployment are compelled to take up an occupation which is beneath them, also in individuals whose *rigid independence* has prevented them from applying for public assistance

Two examples of symbolic lumbago may be given

1 A shop assistant, aged 40, was labelled 'lumbago' He complained of pain right across the lumbar region, and said he felt as if he could not bend" His symptoms of pain and stiffness began in June, and he had been on the sick list for two months There was no evidence of structural change, and I could trace no 'inferiority" He showed objective signs of an anxiety state

Discussion of Aetiology

1 *What kind of man was he?* He was an upright man and an elder of the church

2 *Why did he fall ill in June?* In April he had met a commercial traveller who advised him to "put his shirt on a horse' He had never betted before, but on a sudden impulse decided to follow this advice He borrowed £10 from a moneylender The horse did not get a place, and the man was faced with a debt of £10 His wife, an ardent churchwoman, was in charge of their finances, and he always gave her most of his weekly wage He was afraid to tell his wife about his "fall"—what would she think of me?—and he saw no prospect of meeting his debt He became sleepless and weak, went off his food, and a few days later declared sick with "lumbago'

His inability to bend was a symbol which involved the two related ideas of uprightness and pride On the one hand it may be interpreted *I am an upright man and do not stoop to low pursuits such as betting*, on the other hand it signifies *I am a proud man and cannot lower myself by telling my wife* It was clear that he had to lower himself We discussed his situation, and after breaking down he was able to bend quite freely He left with the intention of confiding in his wife

Note on Breaking Down—Patients who have suffered from "rheumatism" with inability to move a joint, and who show no organic change, sometimes on telling the story of the psychological factors they have met and their reactions to them may become able almost at once to move the affected joint freely For example I saw a man in the late fifties who for one and a half years had continuously attended the out-patient department of an infirmary for fibrositis" of the back and "? adhesions of the right hip He had undergone massage, electrical treatment diathermy radiant heat, and dental extraction, and protein shock was now being considered He was calm and detached and talked about his symptoms as if he were a medical teacher describing a 'case" On investigation as to why he should have taken ill when he did it appeared that he had been in good health until after he had lost his wife, when he became sleepless and went off his food In short he developed chronic emotional reaction out of which his rheumatism had emerged about six months later He sobbed and cried as he related his feelings following his bereavement With encouragement he was able to bend his back freely Also the right thigh which previously could scarcely be moved became slack and attained very quickly its full range of movement It was not localized 'adhesions" and thickening of fibrous tissue that required "breaking down but the individual himself

2 A house painter aged 26 and labelled lumbago," who complained of dull aches in the lumbar region said he 'felt that when he was down he could not rise His symptoms of pain and stiffness began in October and he had been on the sick list for three months There was no evidence of structural change and I could trace no inferiority He showed objective signs of an anxiety state

Discussion of Aetiology

1 *What kind of man was he?* One would not be justified in describing him as either upright or proud, but rather as flexible and simple of heart Five years previously he had married on the strength of having obtained a 'permanent job with a good firm' He had limited his family to one child in order to "give the boy a better chance in life than his father' He was an enthusiastic Territorial He often worked about his house, and liked to see it nice

2 *Why did he fall ill in October?* In June a most unusual thing happened He was sent to prison for three months because in a political argument he had struck his opponent Strange to say, his imprisonment did not depress him "Everyone knew the sentence was unfair' On his release in September he called on his firm confidently expecting to resume his "permanent job but he was told that the situation was filled and that he need not apply again because "the management would not employ criminals" He attempted with great hope and energy to seek a new situation, but without success His job was gone, his "nice" house was going, and his boy was not going to get "his chance in life He became anxious and depressed, and early in October he noticed that after putting on his boots in the mornings before going out to seek for work he experienced pain and stiffness on attempting to rise, and this had persisted During our conversation he was led to discuss the interpretation of his symptoms—namely, "*Life is stiff and I am feeling sore I am down and out, try as I will, I cannot rise* After this, and with reassurance, his movements became free and he agreed he could work if he had employment available

Note—Another complaint referred to the back is "weakness,' and this is sometimes a symbol which may be interpreted *I am spineless and have no backbone, I do not stand up to things I want to lie down to them* Examples of 'back weakness' are seen in persons who are continually losing their employment because of illness which is psychoneurotic but not always recognized as such I remember one young woman who within a span of two years had been in turn domestic servant cinema attendant, shop assistant factory hand, and nursemaid and who on each occasion lost her situation because of illness which necessitated lying down in bed The labels of these illnesses were lumbago debility, fibrositis, anaemia, and rheumatism

Cervical Limitation

The neck is concerned in many expressive movements We have already noted one of these—namely, the action of pride in which the neck as well as the back is involved The proud man "holds' or "carries his head high' The upright man, like the Pharisee who considered that he was not as other men, "lifts up his eyes unto heaven' The neck is also notably concerned in movements signifying affirmation or negation To nod the head as a sign of affirmation and to shake it from side to side as a sign of negation are actions which are widespread among the human species, although according to Darwin they are not universal, and depend, apparently to some extent, on social usage

A sign of negation which is, however, "practically universal" and probably innate is the sudden throwing back of the head This action as a gesture of negation is largely blurred in adults of this country as a result of training and social habit, but it can be observed very clearly in young children When a child not yet able to talk says "No' to what is offered—whether it be food or a toy, a suggestion or a command—he signifies his refusal by violently throwing back his head, indeed he may assume the position of opisthotonos If he continues to say "No" by persisting in holding back the head we describe him as obstinate or stubborn, or, as the translators of the Authorized Version of the Bible put it, stiff-necked We may recall the New Testament phrase about the "stiff-necked generation" and the line from Isaiah "they obeyed not but made their necks stiff"

fits are of frequent occurrence—that it is not surprising that one common denominator applicable to all and sundry has not yet been found The recent work of Gibbs Davis and Lennox (1935) supports the view that the fit is accompanied by an altered conduction of the nerve impulse and increased irritability of the nerve cells, alkalosis and waterlogging being factors of importance in the initiation of the unknown mechanism of the fit (Lennox 1931, Lyon and Dunlop, 1933) Oxygen lack has its advocates but in my opinion the convulsions of the Stokes Adams seizure are not strictly comparable to the fit of idiopathic epilepsy Having personally witnessed a large number of Stokes Adams seizures of all grades of severity, my experience is that in grand mal the clonic stage lasts longer, and the sustained violence of the generalized muscular efforts sharply distinguishes it from the irregular jerking movements of the limbs commonly witnessed in the Stokes Adams attack Further the convulsions of heart block are not preceded by an aura, and the automatic behaviour common enough after an epileptic fit does not appear Incontinence of urine may occur in either condition In spite of the fact that inspection of the brain of epileptics at the initiation of an attack shows a cessation of pulsation in the pial arteries (Penfield 1936) usually widespread over the hemisphere even though the seizure involves only one part of the body the available evidence indicates that cerebral anaemia in itself is not the cause of epilepsy So far as the cerebral circulation is concerned epileptic people have a peculiar vasolability (Penfield 1936) but there is no proof that vasomotor phenomena actually cause the fit Oppenheimer and Fishberg (1928) hold that the fits of eclampsia, lead poisoning and glomerulonephritis are attributable to local vasoconstriction with high blood pressure, but the cause of the vasomotor change remains a mystery Epilepsy of symptomatic origin is probably most often the result of cerebral tumour particularly when situated in the frontal, parietal or temporal lobes (Walker 1936 Gibbs 1932) Neurosyphilis and hypertension with vascular disease are next in importance Epilepsy is not uncommon even several years after penetrating wounds of the dura and the recent careful studies of Penfield (1936) lend hope to the view that surgery will accomplish more for the subjects of traumatic epilepsy in the future The recognition of cysticercosis as a not infrequent cause of fits is of more than academic importance (Dixon and Smithers 1934) Modern methods of investigation lend increasing support to the view expressed by *Oppenheim (1911)* *We must always be on guard* when the epilepsy develops during later life

The Epileptic Borderland

In this connexion it is worth referring to the peculiar attacks designated by the terms 'narcolepsy' and 'pyknolepsy' In the former sudden short attacks of sleep occur unexpectedly and strange attacks of cataleptic paralysis brought on by emotion particularly laughter, make it an easily recognized if somewhat uncommon malady Recently Prinzmetal and Bloomberg (1935) have obtained better results in its treatment by the use of benzedrine sulphate than with ephedrine which hitherto has not proved very satisfactory Pyknolepsy is confined to children It consists of innumerable attacks unassociated with mental deterioration often indistinguishable from petit mal except perhaps in their frequency and in their resistance to all known forms of treatment Fortunately the fits invariably end spontaneously by the time puberty is reached

The syndrome originally described by Gowers (1907) who suggested the term 'vaso-vagal attack' to describe it, might perhaps be renamed in order to distinguish it from the simple syncope or vaso vagal attack of Lewis

Vaso medullary seizure may be a more apt term particularly as Ryle (1931 1934) suggests that this condition is associated with a medullary storm Its relationship to epilepsy is obscure and perhaps no more than fortuitous but in the absence of accurate records of blood pressure pulse rate and response to drugs it is not yet justifiable to include this peculiar state amongst the better known disorders of the autonomic nervous system

Arising sometimes unexpectedly but often after a period of prolonged mental strain or anxiety the attack is sudden and lasts for ten minutes or half an hour before the symptoms begin to abate The most striking urgent and dreaded of the symptoms is a sense of impending death (Ryle 1934) With this comes a sense of utter powerlessness and profound weakness a sense of unreality in the environment a sinking or floating feeling, and occasionally some precordial discomfort often distinct dyspnoea a sensation of choking or tingling in the *extremities Facial pallor cold perspiration and* an appearance of grave illness are at once evident The pulse is generally slow and of poor volume The attack is not a hysterical phenomenon though it is often vaguely labelled 'nerves' or confusedly designated a 'heart attack' In some ways particularly in its utter helplessness it resembles the milder symptoms of hypoglycaemia experienced by certain diabetics So far as I am aware these attacks alarming in themselves are never fatal and whatever the precise mechanism reassurance as regards the future combined with sedative drugs—such as small doses of luminal—does much to diminish their frequency In diagnosis a careful analysis of the patient's symptoms the fact that consciousness is *maintained the duration of the attack and the gradual* recovery without convulsions serve to distinguish the condition from either the Stokes Adams seizure or the epileptic attack I have seen several examples of this condition one man developing true idiopathic epilepsy five years after the first vaso medullary seizure This sequence is however exceptional

In such a large field I realize that I have only touched on a few aspects of a fascinating clinical problem My remarks have been based on personal experience of some of the difficulties of diagnosis—difficulties I believe which can be largely surmounted by an accurate clinical history but more particularly by the good fortune of actually witnessing the attack for accurate clinical observation and detailed but simple facts will solve most clinical problems

peutic purposes Quinine treatment was instituted and on November 2 only a few parasites were present She had no further relapses and no more parasites were found

Case II.

A police commissioner was first seen on December 9, 1935, fourteen days after his arrival in England He had served for seventeen months in Nigeria, where he had suffered from insomnia and loss of energy, and had complained of pain in the left side, which was attributed to a renal calculus His spleen was slightly enlarged, but prolonged search revealed no malaria parasites in his blood On January 15, 1936, he complained that during the three previous weeks he had had several mild attacks of fever, they always occurred at night, and were accompanied by pain in the lumbar region The spleen was now found to be hard and large, and examination of blood films disclosed a heavy *P ovale* infection in all stages of development Atebrin treatment was begun, and on February 1 the spleen was normal again, and the blood free from parasites, and he had had no further pyrexial attacks

Case III

The wife of a company official had been two years in Stanleyville (Belgian Congo), where she had had one attack of malaria in March, 1935 She had a second attack in the following December, which lasted for five days and necessitated hospital treatment She returned to England on July 14, 1936 and eight days later had an attack of fever with rigor, which began at 6.30 p.m. and was associated with pain in the centre of the abdomen Atebrin treatment was commenced but was interrupted by the removal of the patient's appendix on July 24 Two days afterwards the pyrexia returned, the temperature reaching 103° F., she vomited, and had pain in the back The spleen was slightly enlarged, and examination of blood films showed numerous half-grown *P ovale* parasites Atebrin treatment was recommenced, and the patient made an uninterrupted recovery

Case IV

An engineer had served one and a half years in Sierra Leone during which time he had had several mild attacks of fever In September, 1935, his appendix was removed When seen first on April 3, 1936, he complained of pain over the gall bladder area and was neurasthenic The spleen was then not enlarged, and no parasites were found in the blood On May 27 he stated that he had suffered from daily attacks of fever in the evenings, with aching in the bones and lumbar region The spleen was now much enlarged, and blood films showed a fairly heavy infection with half grown and gametocyte forms of *P ovale* He reacted immediately to atebrin treatment the aches and pains disappearing on the second day On August 28 the neurasthenic symptoms had subsided the spleen was normal and the blood showed no further evidence of infection

In view of the commonness of oligomenorrhoea or amenorrhoea in women with Graves's disease V. Jonas and E. Markalous (*Zbl. Gynäk.* October 31, 1936, p. 2614) estimated by injections into castrated mice, the folliculin content of the urine of eighteen patients with well-marked signs of thyroid hyperactivity The amount found was on the average about one-seventh of that in normal females and was less than in patients examined during a remission of the ailment Of the eighteen women six had normal menses four oligomenorrhoea, and the remainder secondary amenorrhoea
